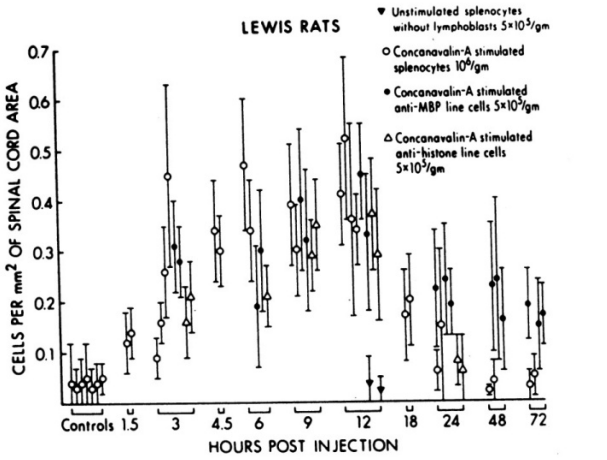
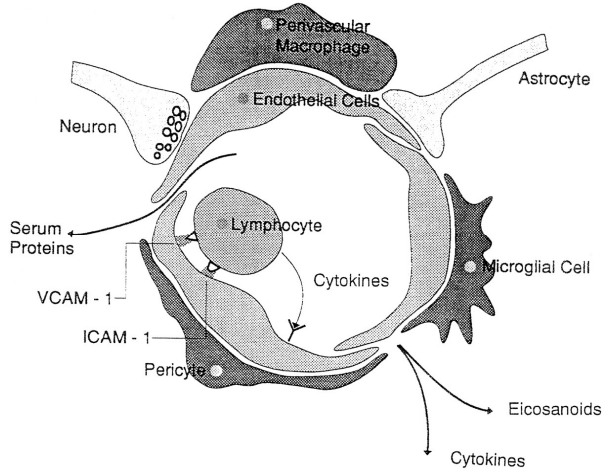
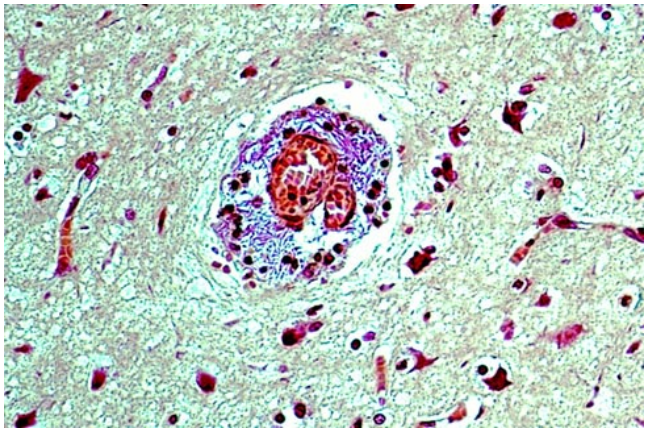
Myths of CNS Immunology

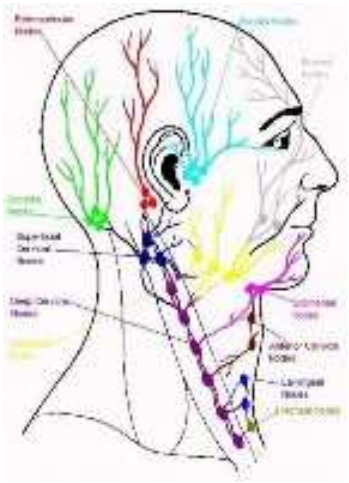
Immune cells do not gain access to the CNS secondary to the blood brain barrier





There is no lymphatic drainage from the brain

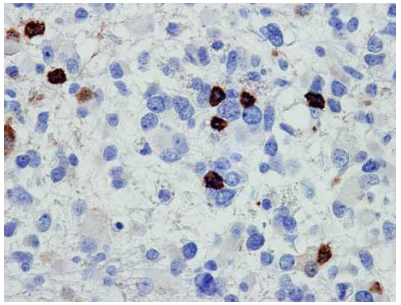




THE UNIVERSITY OF TEXAS
MD Anderson Cancer Center
Making Cancer History®

What is needed for an optimal anti-tumor immune therapeutic response?

- Immunological target (i.e. antigen) or a response that is not dependent on this (NK cells)
  - **EGFRvIII**, **IDH1 mutant, IMA-950**, **CMV pp65, HSP, tumor homogenates**
- Activate the T cell signal
  - 4-1BB antibodies/aptamers, OX40 antibodies, pro-inflammatory cytokines (**GM-CSF, IFN-γ**, IL-12, IL-15), **KLH, TLR agonists (CpG, poly IC**), **dendritic cells, viral therapy**, STING agonists
- Adequate trafficking to and infiltration of the tumor site
  - Chemokine (fractalkine receptor/CX3CR1)



- Maintenance of T cell effector function
  - **Inhibition of immune suppressive cytokines (TGF-β, IL-10),** STAT3 inhibitors, **checkpoint inhibitors**

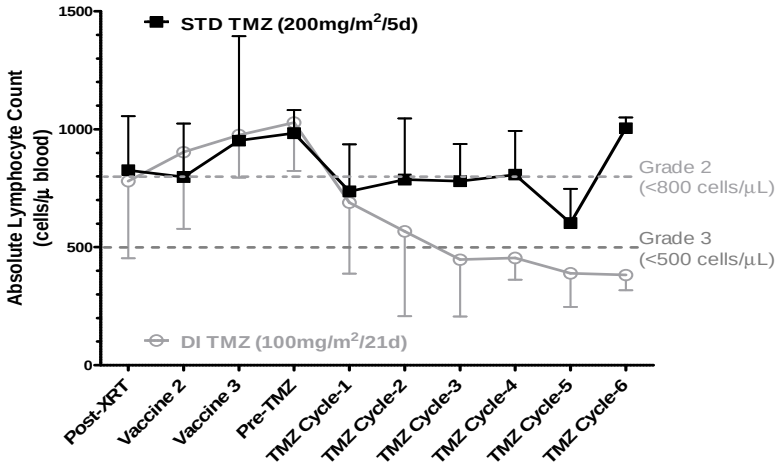
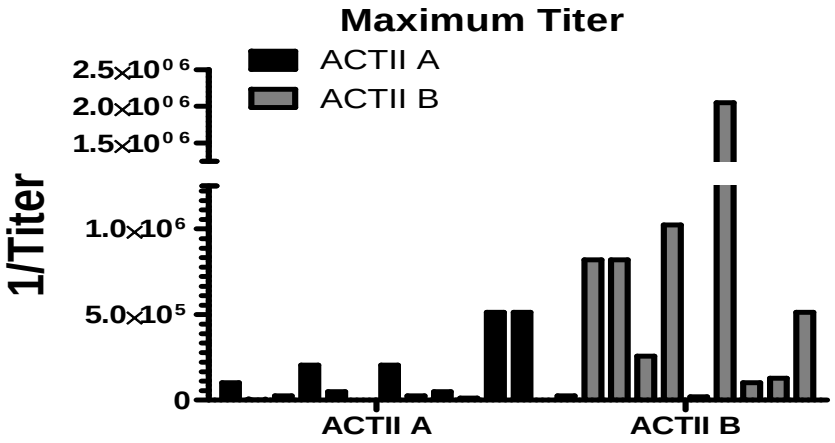
TMZ induced lymphopenia enhances immunological responses: ACT II





Sampson/Heimberger, Neuro-Oncology, 2011

THE UNIVERSITY OF TEXAS
MD Anderson Cancer Center
Making Cancer History®

Summarized Clinical Efficacy of the PEP-3-KLH Vaccine in Glioblastoma Patients

	Clinical Sites	Median PFS from Diagnosis (months)	Median OS from Diagnosis (months)	OS at 24 Months
ACT III (n=65)	31	12.3	24.3*	50%*
ACT II (n=22)	2	15.3	24.4	50%
ACTIVATE (n=18)	2	14.2	24.6	50%
Matched historical control (n=17)[1]	1	6.4	15.2	6%
Standard of care radiation/TMZ (n=287)[2]	85	6.9	14.6	27%

- In all three rindopepimut trials, study treatment began ~3 months post-diagnosis
- Historical controls were treated at M.D. Anderson and matched for eligibility (EGFRvIII-positive, KPS ≥ 80%, complete resection, radiation/TMZ and without progression through ~3 months post-diagnosis)
- Confidence intervals for median PFS and OS for vaccinated patients do not overlap with those for historical control and standard of care
- Mature data for ACT II and ACTIVATE are presented

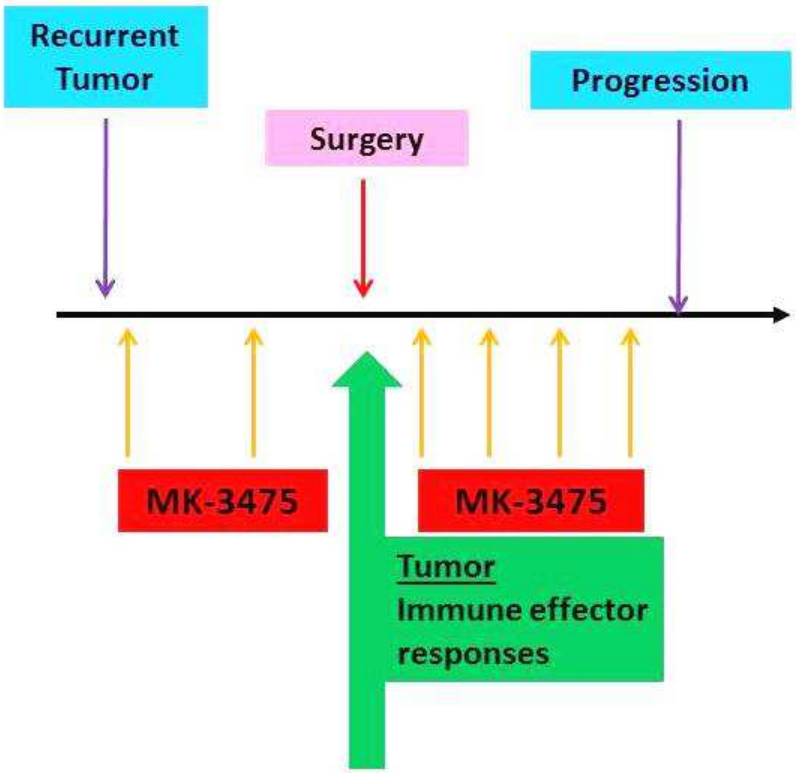
Key Biomarker Issues for Immune Therapeutic Clinical Trials

- There is no universally accepted peripheral blood immune assays that correlates with clinical efficacy/polyvalent immune responses.
- Monitoring will need to be tailored to the select agents
- Peripheral blood monitoring does not take into account effector function at the tumor site.
- No vetted imaging approach for determining the presence or absence of an immune response in the tumor microenvironment.
- Assumption of generalized immune assays for monitoring responses (harmonization)
- Immunotoxicity
- Radiographic monitoring of immune responses

THE UNIVERSITY OF TEXAS
MD Anderson Cancer Center
Making Cancer History®

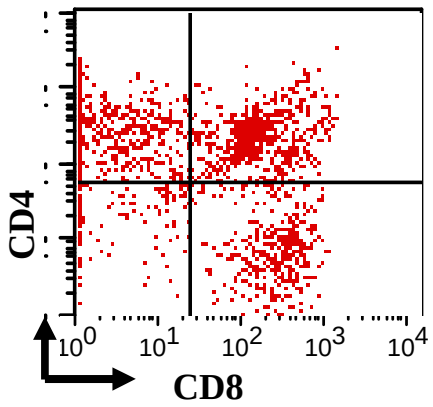
Immune Checkpoint Clinical Trials in GBM

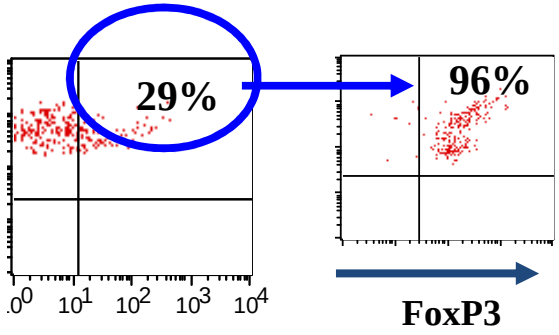


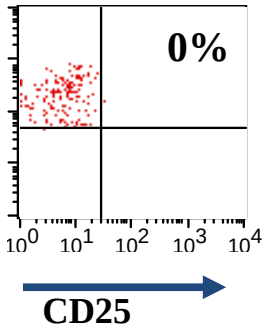
MERCK

- Is there an increase in the frequency of the T cells?
- Is there modulation of checkpoint expression in tumor infiltrating immune cells?
- Are there increased functional T cell responses (IL-2R, IFN-γ, TNF-α, granzyme B, perforin)?

Activated CD4+ T cells are predominantly Tregs







CD8+ T cells are not activated

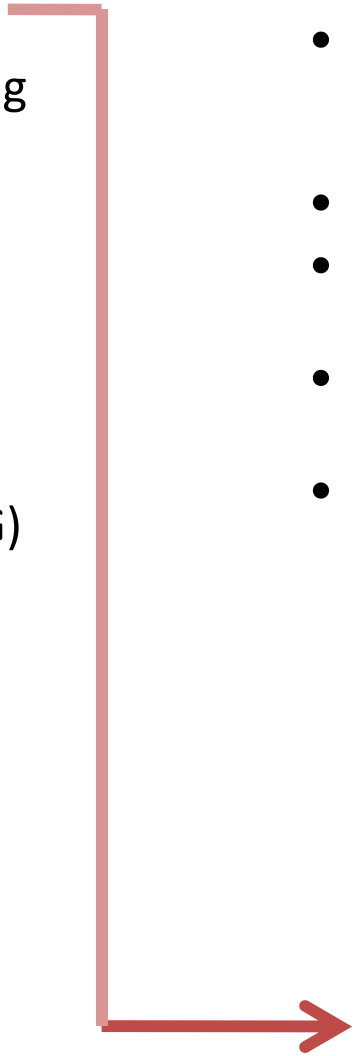
Immune suppression in Malignant Glioma Patients

Mechanisms

- Cytokines – IL-10, TGF, PGE2
- Lack of functional antigen presenting cells i.e. immunosuppressive microglia/macrophages (microglia, paucity of myeloid dendritic cells)
- Induction of T cell apoptosis (FasL; Galectin-3)
- Treg recruitment to the tumor
- Increase expression of immune regulatory molecules (B7-H1, HLA-G)
- Loss of antigen
- Decreased B2 microglobulin and/or HLA
- Induction of inappropriate T-helper function (skewing to Th2)
- Cancer stem cells/initiating cells
- Tumor hypoxia/HIF-1α

Manifestations

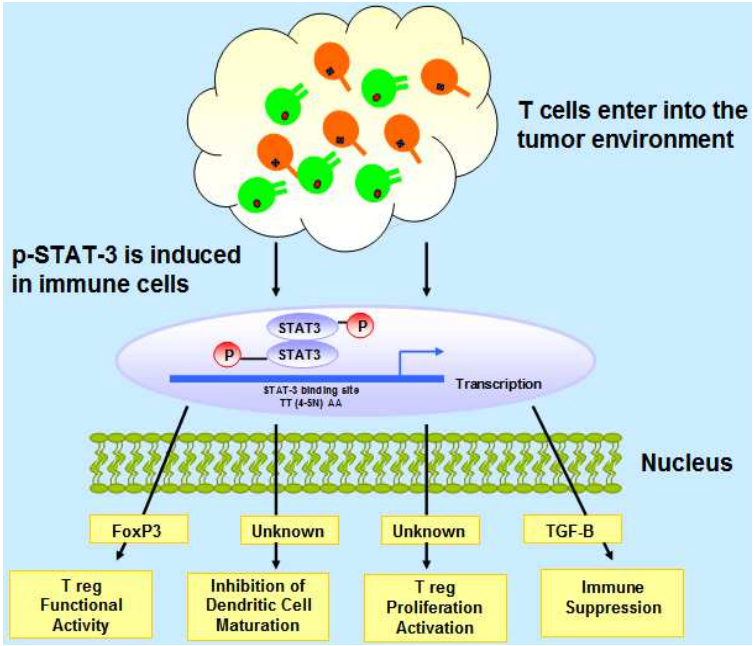
- Decreased delayed type hypersensitivity responses to recall antigens
- Diminished antibody responses
- Impaired T cell proliferation and responses to IL-2
- Impaired cytotoxic/effector T cell responses
- T cell anergy/unresponsiveness



Is there a common pathway?

THE UNIVERSITY OF TEXAS
MD Anderson Cancer Center
Making Cancer History®

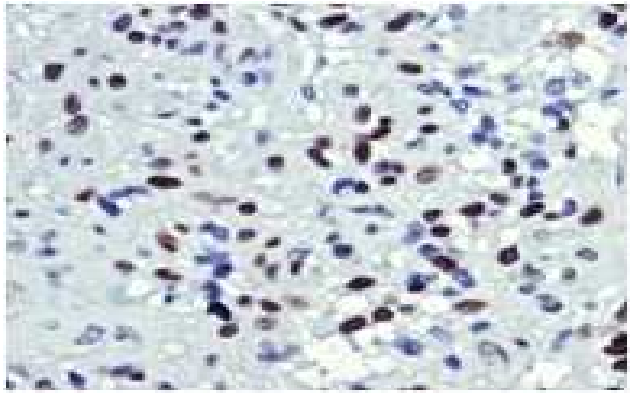
The STAT3 pathway is a key regulatory pathway in global immune suppression

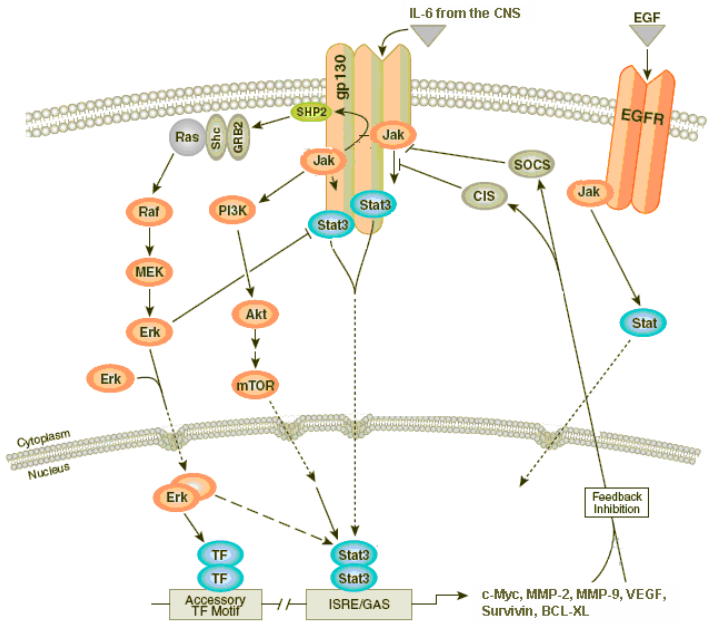


- pSTAT3 becomes active in immune cells in the presence of malignancy (Yu, Nature Rev Immunology, 2007).
- Induces the expression of immune suppressive cytokines
- STAT3 activity turns off antigen presenting cells like dendritic cells.
- STAT3 suppresses macrophage/microglia activation and function; induces M2 macrophages.
- STAT3 is a transcriptional regulator of FoxP3 in Tregs (Zorn, Blood, 2008).
- Ablating STAT3 in hematopoietic cells in mice resulted in marked enhancement of immune responses and marked anti-tumor activity (Kortylewski , Nat Med, 2005).
- STAT3 blockade in the immune cells from glioma patients can restore T cell proliferation and responses.
- Can be found in the peripheral blood of malignant glioma.

THE UNIVERSITY OF TEXAS
MD Anderson Cancer Center
Making Cancer History®

The STAT3 pathway is active in many cancers and especially within malignant gliomas





- Constitutive activation is observed in majority of many malignancies or can be induced by EGF, PDGF, IL-6, IFN, CMV, TLR-9 (among others).
- Upon phosphorylation of tyrosine^{705} (p-STAT3), dimerization occurs and subsequent nuclear translocation.
- The p-STAT3 is a potent transcriptional factor that regulates key factors that mediate tumor proliferation and survival (e.g., cyclin D1, p53, BCL-XL), migration and invasion (e.g., MMP-2, MMP-9), and angiogenesis by VEGF, basic fibroblast growth factor, and HIF-1α.
- Is a negative prognostic factor for survival.
- Shown to mediate the proneural to mesenchymal transition .
- Maintains “stemness” (Sherry, Stem Cells, 2009).

STAT3 positively and significantly correlates with glioma grade

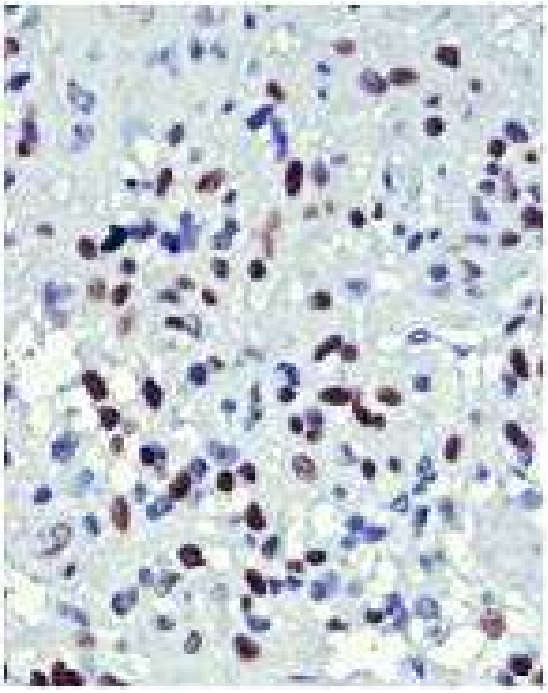


Table 3. Proportion of p-STAT3–positive cases according to pathology and WHO tumor grade.

Pathology	p-STAT3 >0/Total (%)	*Mean (SD)	(Min, Max)
O	6/16 (38%)	4.3 (7.7)	(0.0, 23.5)
MOA	6/6 (100%)	67.9 (55.2)	(9.0, 136.0)
AO	6/15 (40%)	17.5 (41.0)	(0.0,153.0)
AMOA	7/12 (58%)	13.3 (27.0)	(0.0, 85.5)
LGA	0/3 (0%)	0	0
AA	9/17 (53%)	5.6 (7.6)	(0.0, 23.0)
GS	5/7 (71%)	23.1 (34.1)	(0.0, 91.0)
GBM	27/53 (51%)	11.7 (24.4)	(0.0, 133.5)

Abbreviations: AA, anaplastic astrocytoma; AMOA, anaplastic mixed oligoastrocytoma; AO, anaplastic oligodendroglioma; GS, gliosarcoma; LGA, low-grade astrocytoma; O, oligodendroglioma; MOA, mixed oligoastrocytoma.

*The mean calculation was based on the mean p-STAT3 value.

A Phase I Trial of WP1066: NCT01904123

Dose Escalation Schedule	
Dose Level	Dose of WP1066*
Level 1	0.08
Level 2	0.15
Level 3	0.3
Level 4	0.6
Level 5	1.15
Level 6	2.3
* Doses are stated as exact dose (e.g., mg/kg)	

Toxicity observed in 1 patient	Change to dose escalation schema
Grade 1 adverse event	No change; enroll next patient in next higher dose level at double the previous dose.
First grade 2 adverse event	No change; enroll next patient in next higher dose level at double the previous dose.
Second grade 2 adverse event	Expand current cohort to enroll a total of 3 patients; future dose-escalation will occur in 33% increments.
First grade 3 non-DLT toxicity	Expand current cohort to enroll a total of 3 patients; future dose-escalation will occur in 33% increments
First DLT	Expand current cohort to enroll a total of 3 patients; if no further DLT is noted among these three patients, 3 more patients will be added at this dose level; if only one of the 6 patients experiences a DLT, the dose may be escalated by 25% in the next cohort of 6 patients.

Key Features:

Dose escalation proceeds according to an accelerated titration design

Biomarker endpoints include pharmacokinetic bioavailability of WP1066, PBMC p-STAT3 levels, peripheral blood Tregs frequency, and T cell effector responses

Retrospective analysis of GBM subtype (mesenchymal, proneural, classical, neural) with treatment response to WP1066

Measurement of effect includes radiographic responses using $RECIST_{immune}$ criterion

The primary objective is to determine MTD, safety and tolerability

Secondary objectives include: pharmacokinetic, immune, radiographic, PFS and OS parameters

Total number of patients: 21

Challenges/Opportunities for Immunotherapy

- Does the immune system really prevent the development of gliomas? If so, what is the trigger.
- Uncharacterized immune suppressive mechanisms (exosome)
- Immune suppressive features of low grade glioma
- Cost and production ease of GMP cellular products
- Target only membrane expressed targets
- Redundancy of immune suppression
- Assumption of generalized immune assays for monitoring responses (harmonization)
- Polyvalent immune response
- Immunotoxicity
- Synergy with conventional chemotherapeutics/radiation/steroids
- Radiographic monitoring of immune responses
