# Hepatocellular carcinoma

- HCC is the most common type of primary liver cancer
- 3<sup>rd</sup> leading cause of cancer death worldwide
- Treatment options:
  - Curative: orthotopic liver transplantation, surgical resection
  - Chemoembolization, radiofrequency ablation, microwave ablation, radiation, chemotherapy, targeted therapy
- Many patients are ineligible for surgery/transplant/RFA – there's a need for systemic therapies in HCC

# Conclusions

- Immune checkpoint inhibitors are beginning to fill the need for systemic therapies in hepatocellular carcinoma
- To date, only MSI-high/MMR-deficient colorectal cancers have approved immunotherapy options
- For gastric, gastroesophageal, and esophageal cancers, PD-L1 expression may be important for checkpoint inhibitor responses
- Future directions for all indications include combination therapies
