Ipilimumab Pattern of Response: Responses After the Appearance and Subsequent Disappearance of New Lesions

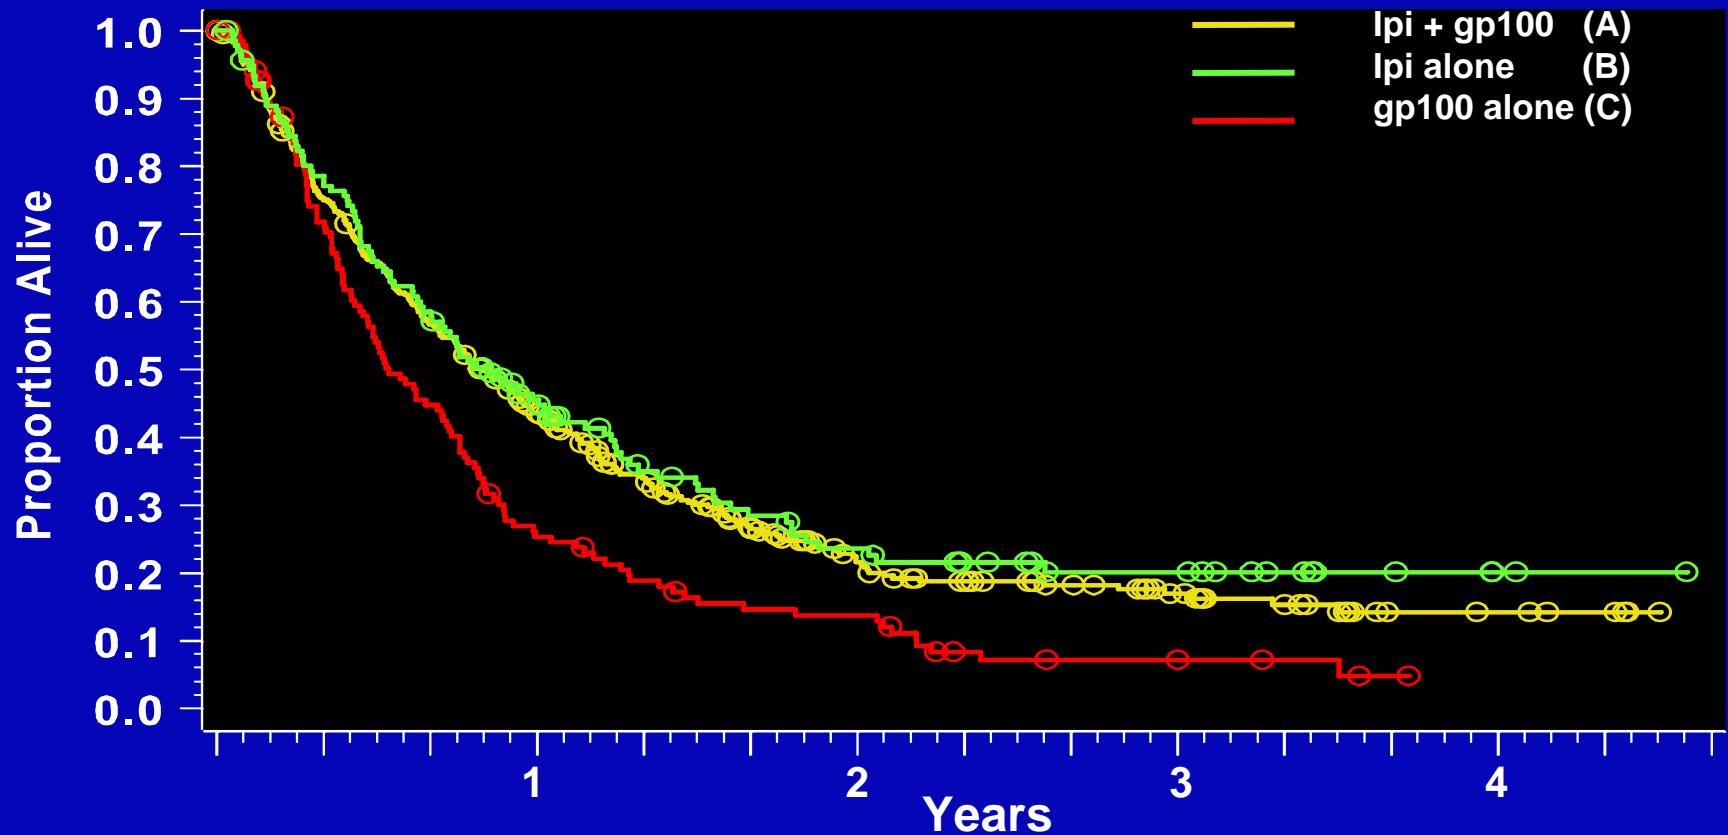

Hypopigmentation

MDX010-20: Study Design

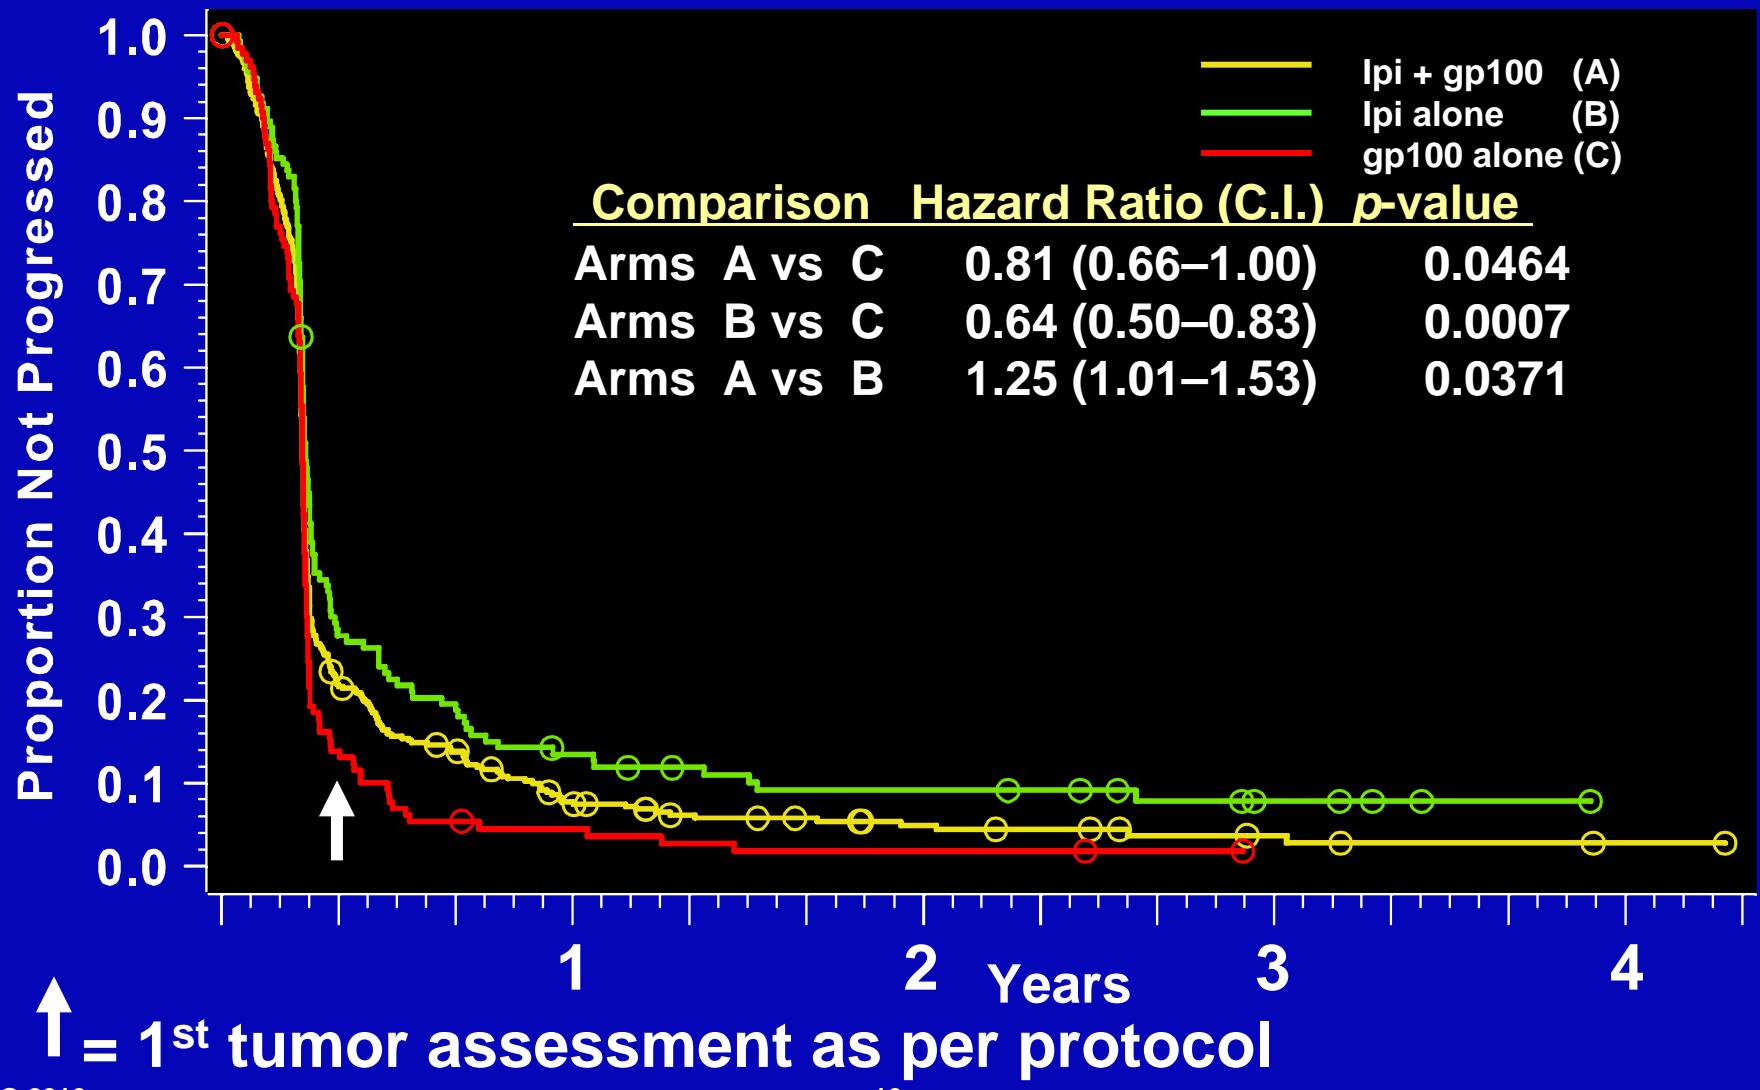

Kaplan-Meier Analysis of Survival

Survival Rate	Ipi + gp100 N=403	Ipi + placebo N=137	gp100 + placebo N=136
1 year	44%	46%	25%
2 year	22%	24%	14%

PFS: Impact of Both Ipilimumab Regimens vs gp100

Ipilimumab Improves Best Objective Response Rate (BORR)

	Arm A Ipi + gp100 N=403	Arm B Ipi + pbo N=137	Arm C gp100 + pbo N=136
BORR, %	5.7	10.9	1.5
P-value: A vs C		0.0433	
P-value: B vs C		0.0012	
DCR‡, %	20.1	28.5	11.0
P-value: A vs C		0.0179	
P-value: B vs C		0.0002	

‡Disease control rate: percentage of patients with CR, PR, or SD

Vaccines and CTLA-4 Blockade

- Pre-clinical models in melanoma support synergy
- Clinical trial shows equivalent overall survival but inferior response and disease control rates
 - Correct vaccine?
 - Antigen escape?
 - Polarization of response?
 - Antigen sink?

CTLA-4 Blockade: A Case Study for Immunotherapy in Need of Biomarkers

Knows

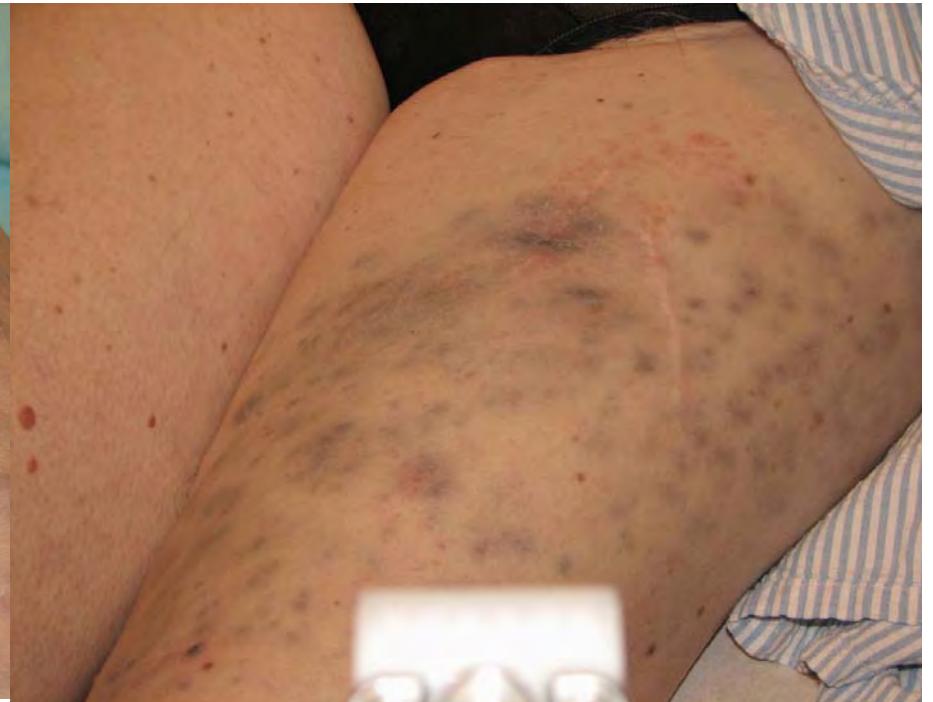

- Clinical benefit for a subset of patients with refractory melanoma
- Reversible mechanism-based side effects
- Tumor responses tend to be durable
- Kinetics of response unlike cytotoxics

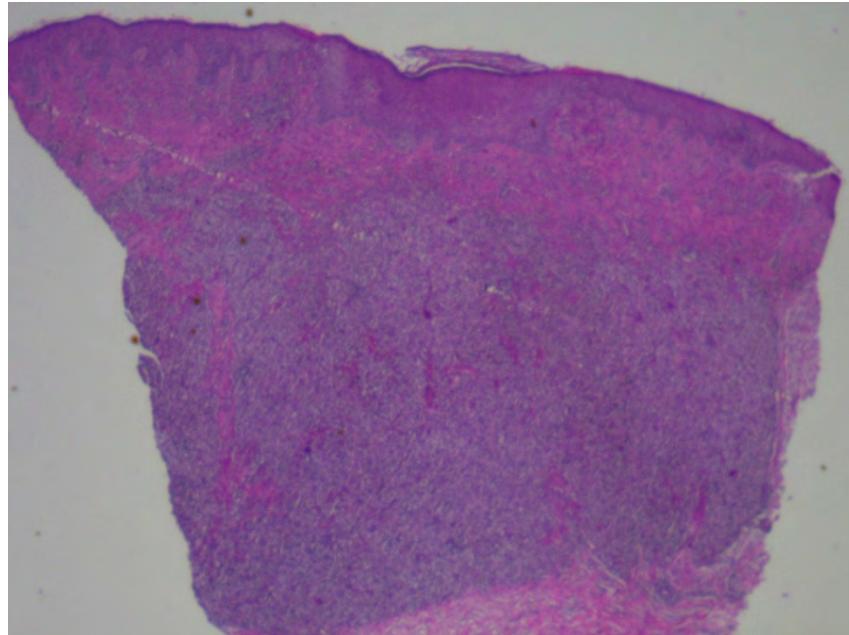

Unknowns

- Biomarkers for response
- Biomarkers for toxicities
- Effect on effector vs regulatory T cells in humans
- Antigens recognized after infusion
- Importance of vaccination before treatment
- Relevance of PBMC vs tumor site findings

NY-ESO-1 antibody and CD4 T-cell response were detected after full-length NY-ESO-1 protein vaccination

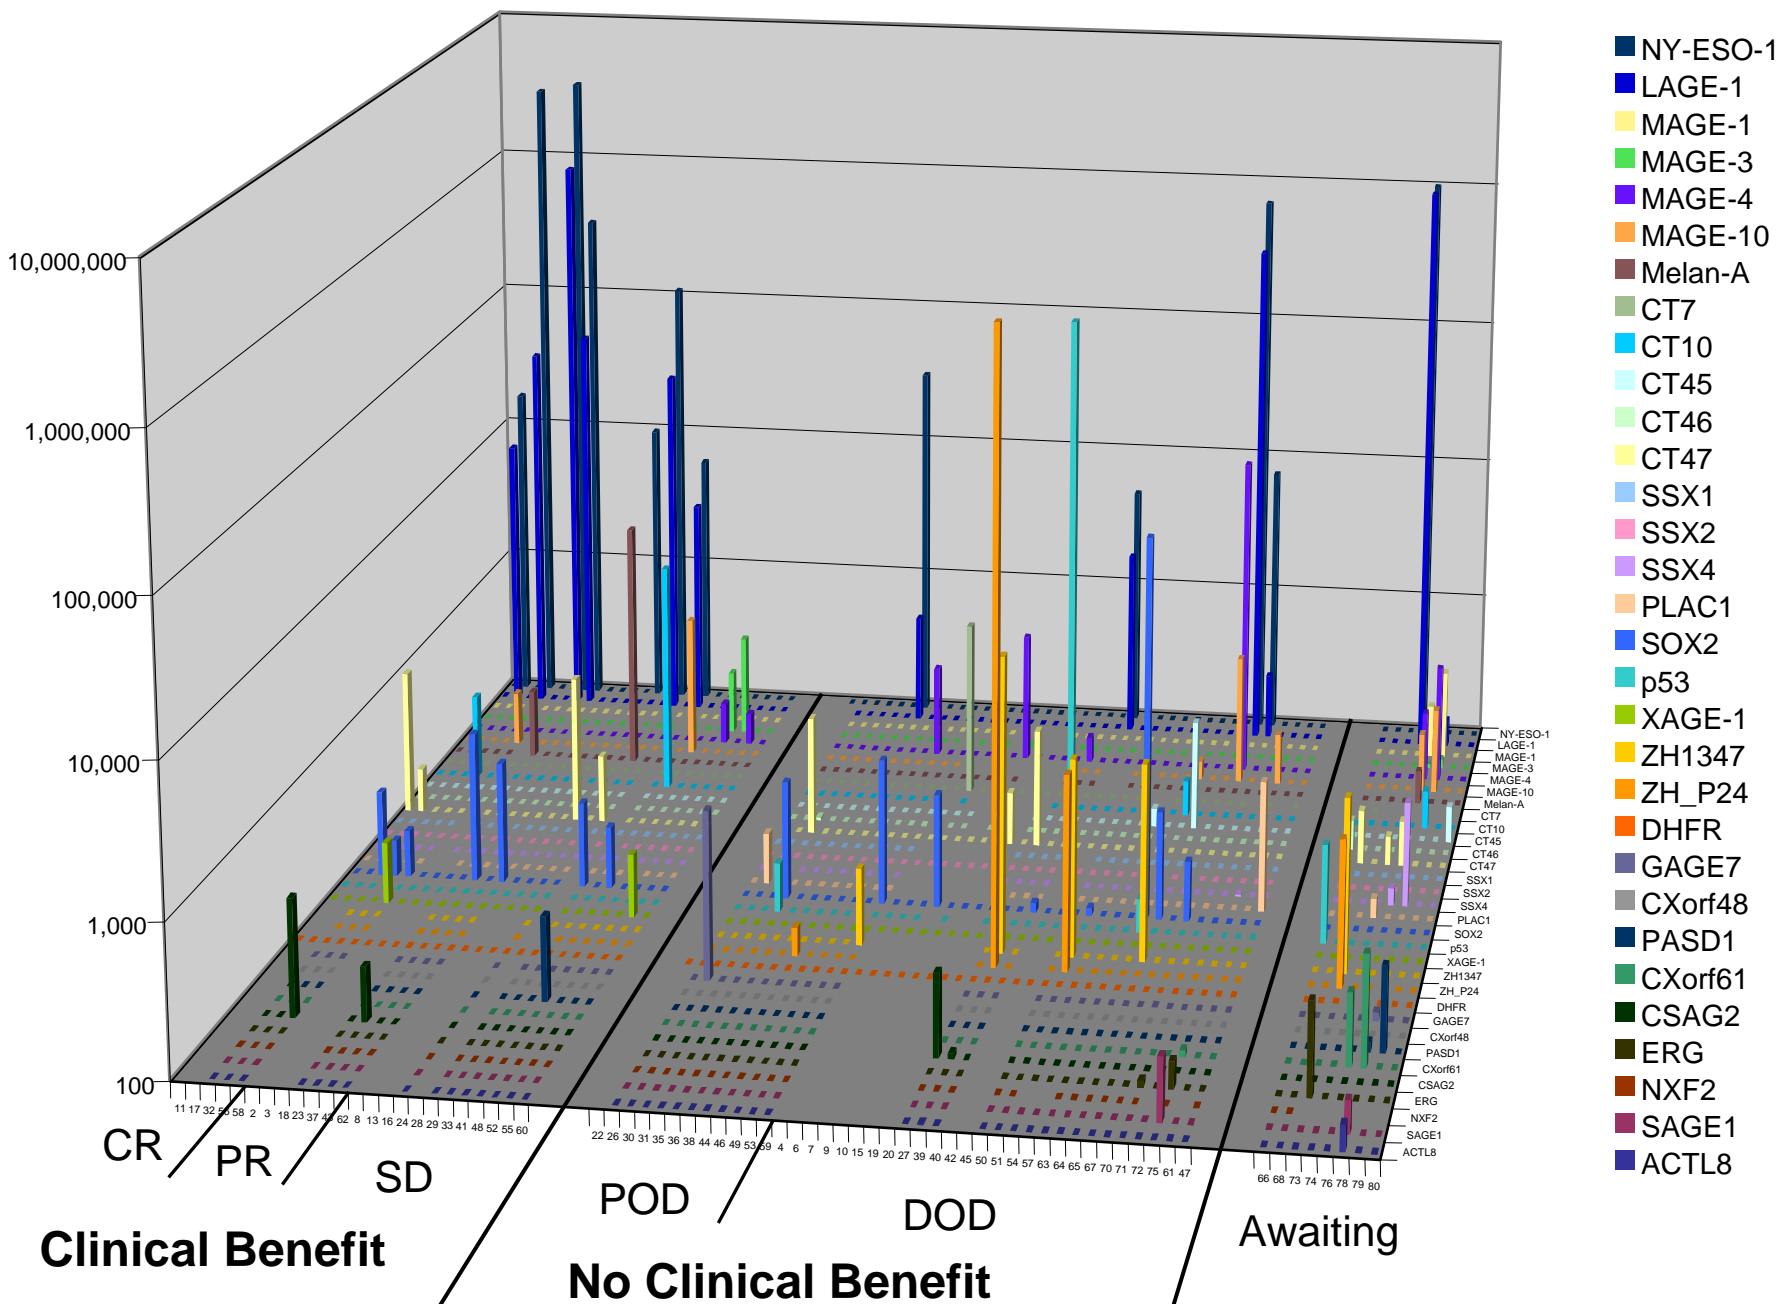

Modified from Adams S et al. J Immunology 2008, 181:776

NY-ESO-1 CD4 and CD8 T-cell specific response after CTLA-4 blockade (Patient IMF-11)

Grand Serology in CTLA-4 treated patients (peak response): Correlation with clinical benefit

Correlation of NY-ESO-1 antibody with clinical course following anti-CTLA-4 treatment

Patients with NY-ESO-1 antibodies at any time point during study

Response	# patients Status at wk24 (%)	# NY-ESO-1 SERONEGATIVE Status wk24 (%)	# NY-ESO-1 SEROPOSITIVE Status wk24 (%)
CR	6 (5.1%)	4	2
PR	14 (12.0%)	9	5
SD	25 (21.4%)	19	6
Clinical Benefit	45 (38.5%)	32 (33.7%)	13 (59.1%)
No Clinical Benefit	72 (61.5%)	63 (66.3%)	9 (40.9%)
Total	117 (100%)	95	22

According to Immune-related response criteria:

Fisher's exact test:
P value 0.0498

CR: Complete Response

PR: Partial Response

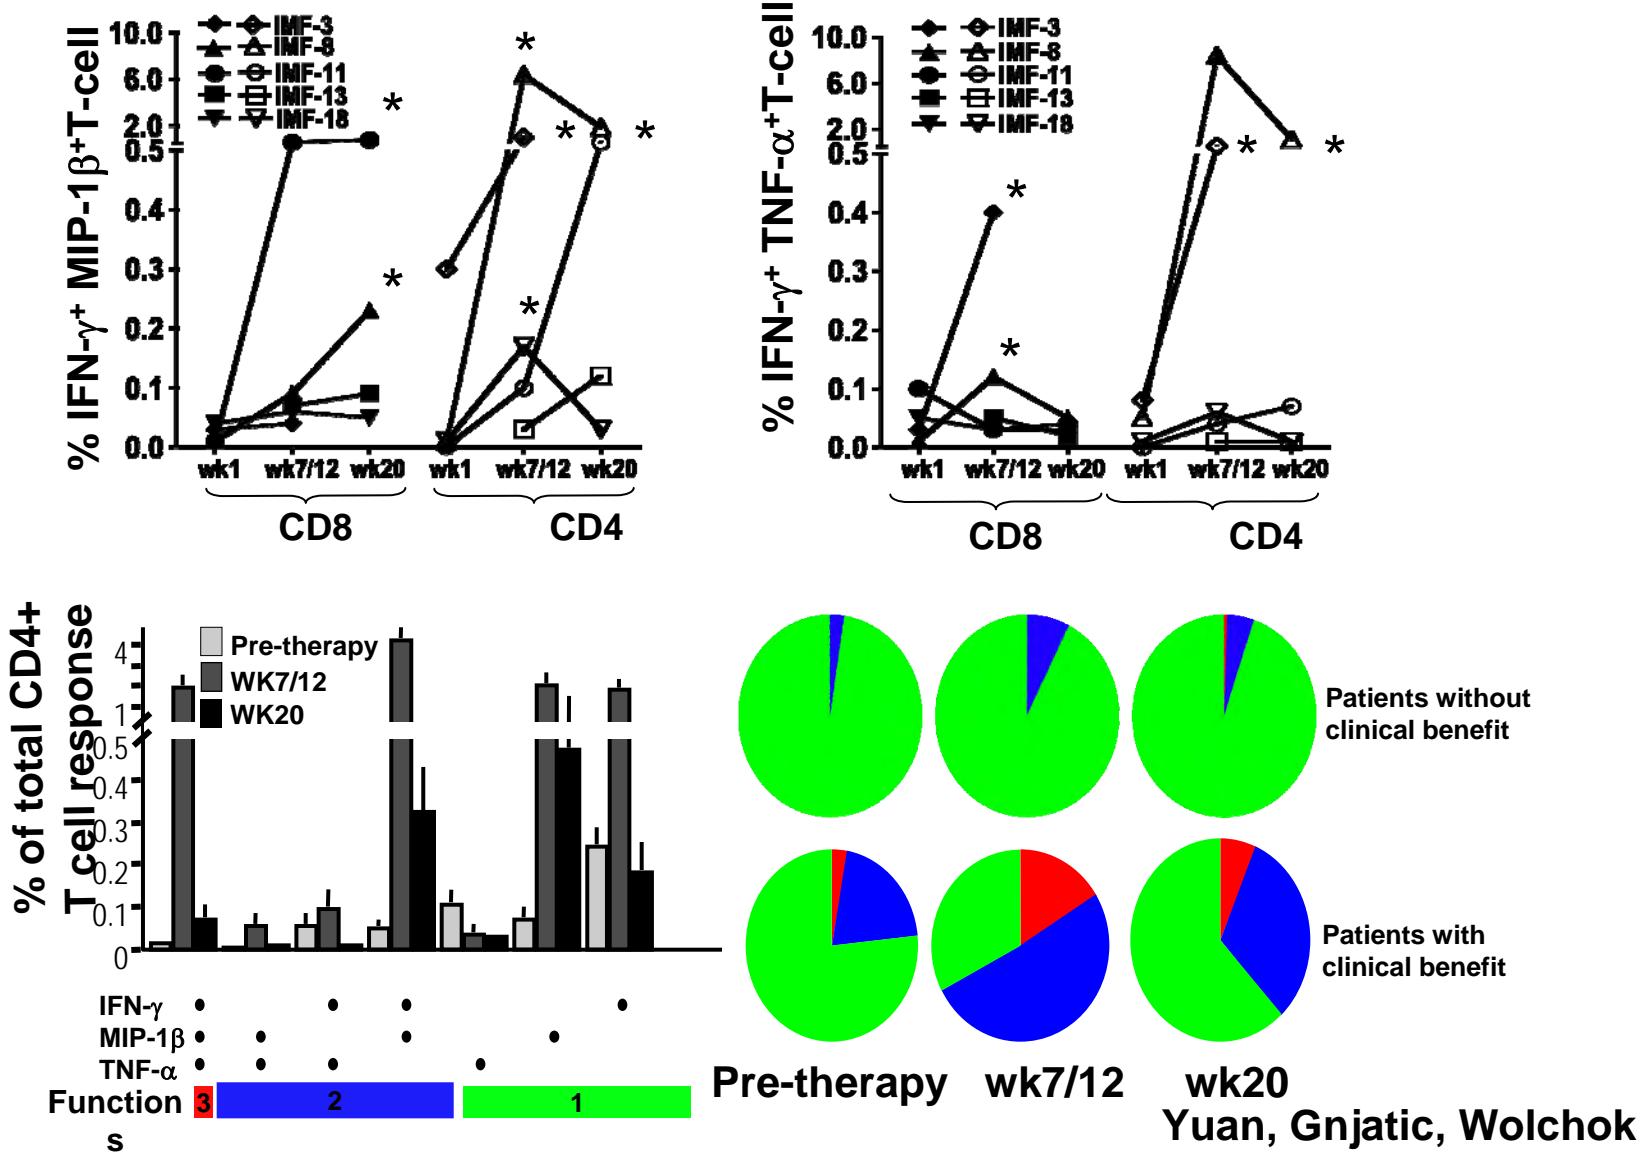

SD: Stable Disease

POD: Progression of Disease (includes MR: mixed response)

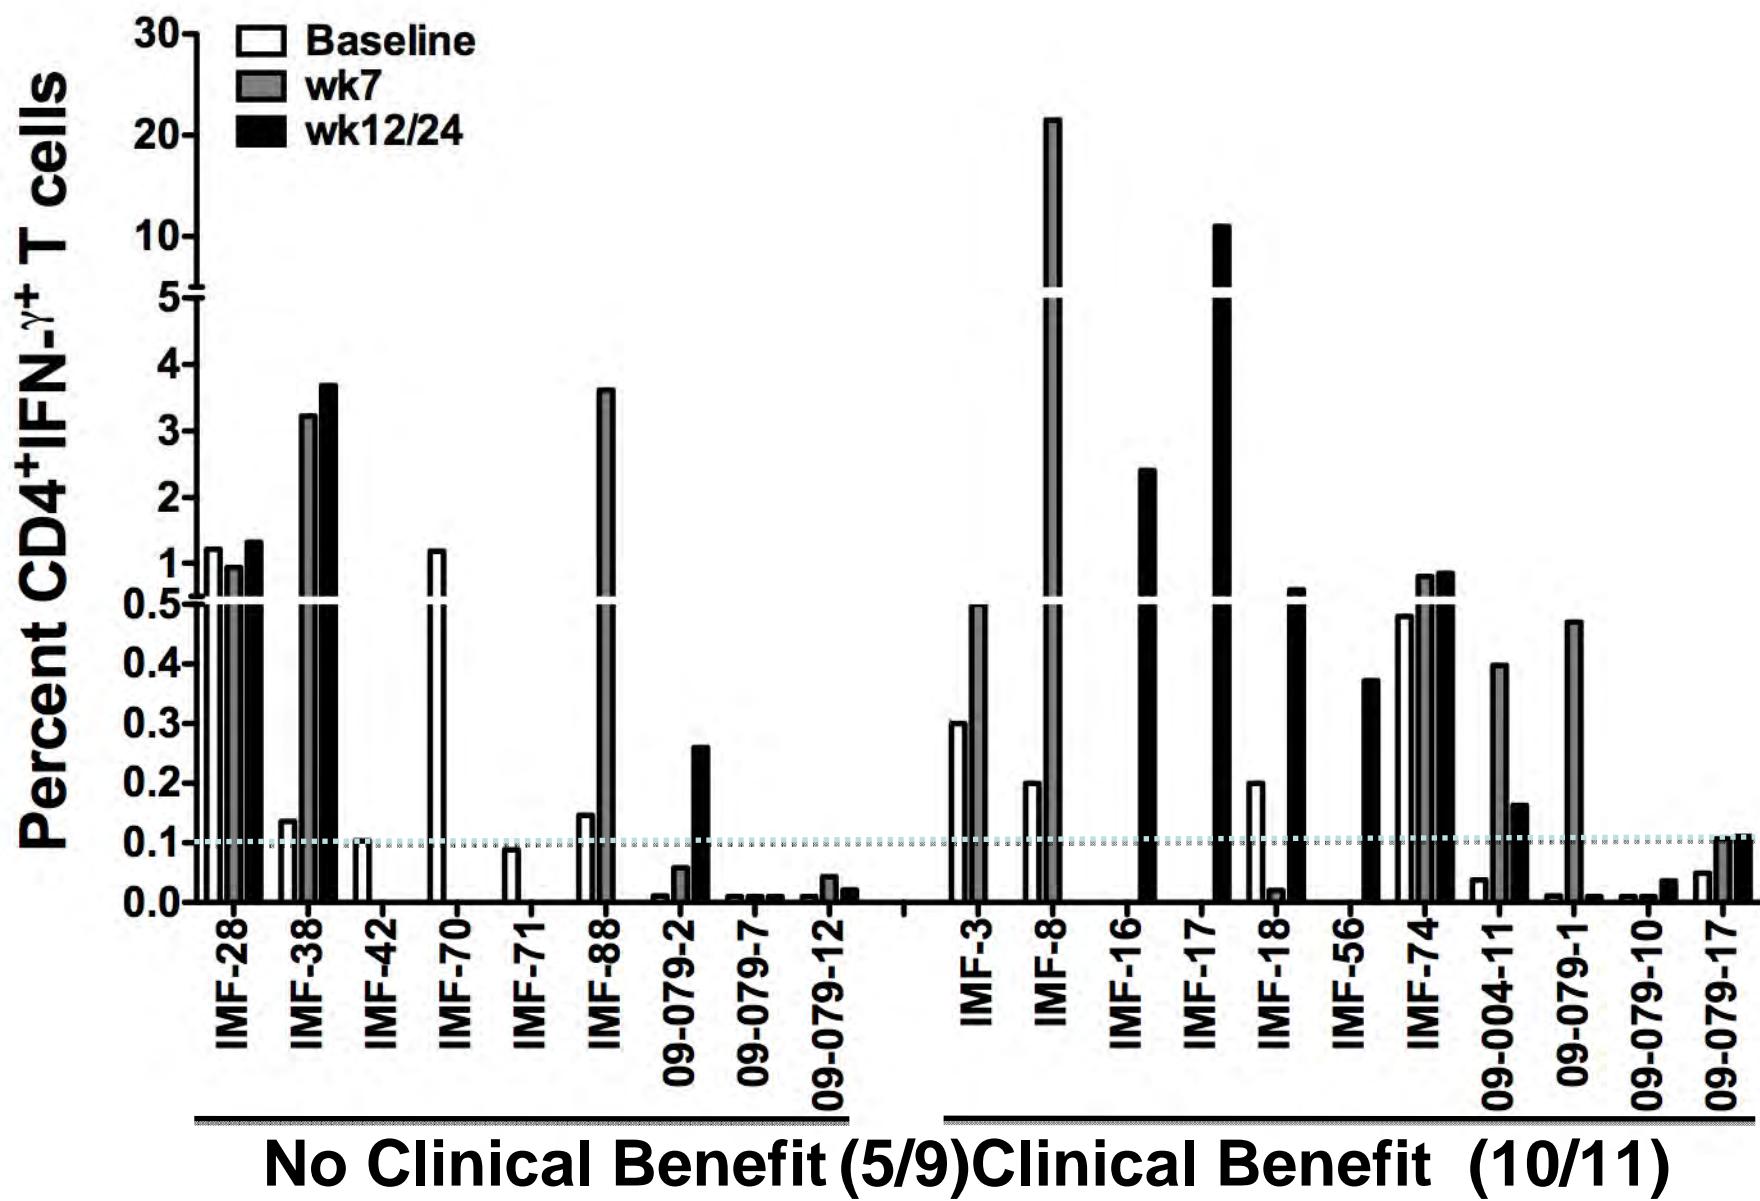

DOD: Dead of Disease

DNA vaccination trial 00-142
GM-CSF DNA + gp100 and tyrosinase peptides

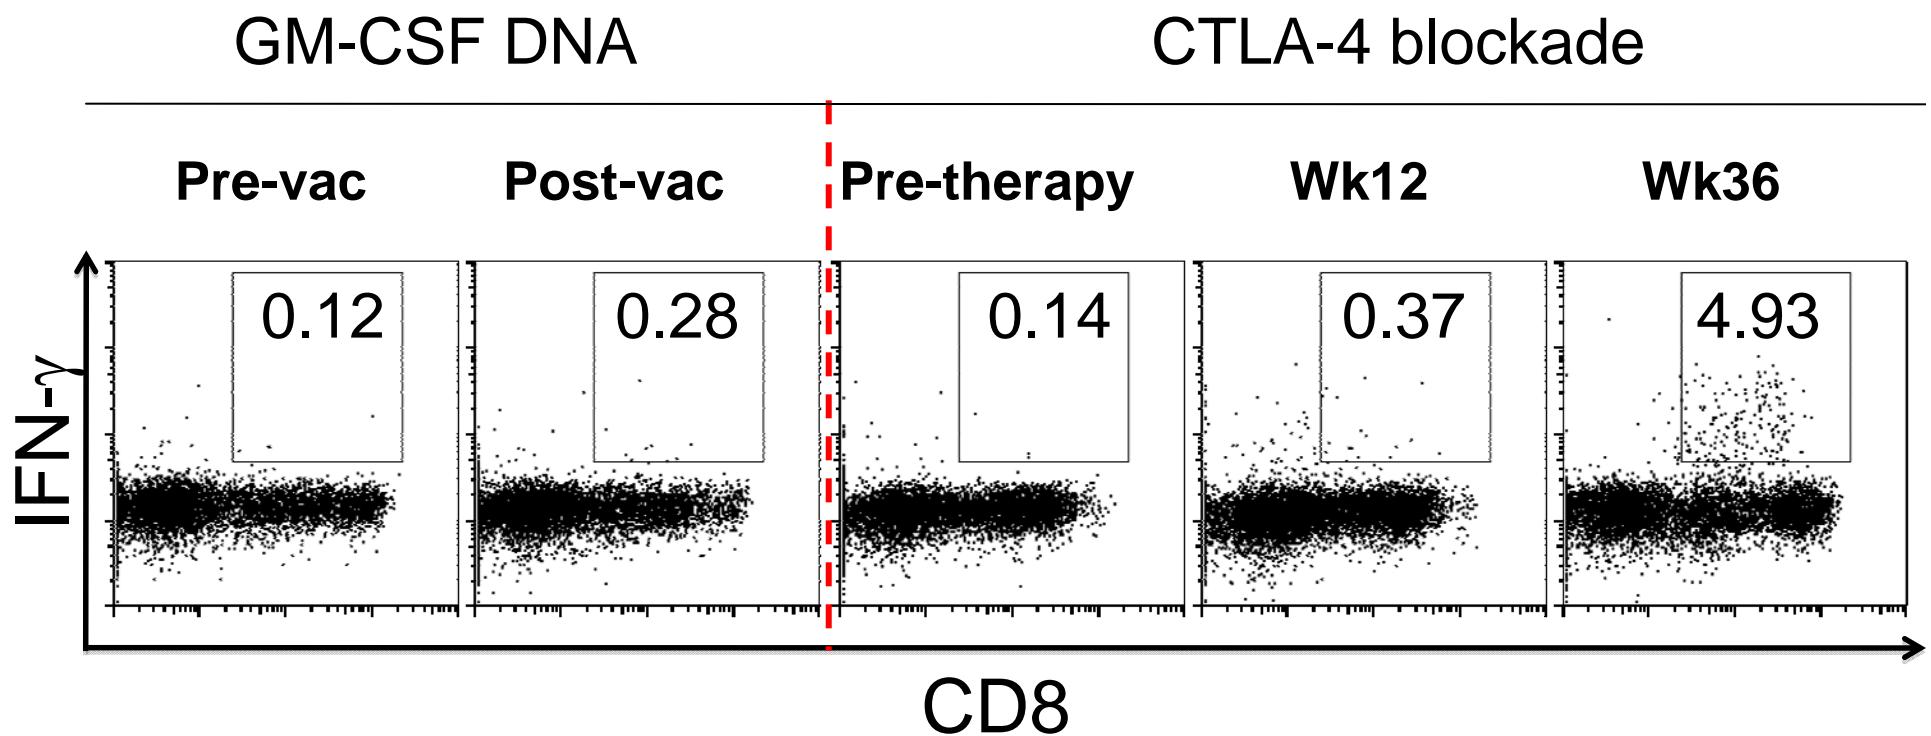

Jan 2008

Anti-CTLA-4 antibody trial (CA184-008)
Ipilimumab
10 mg/kg
Every 3 weeks x four doses ++

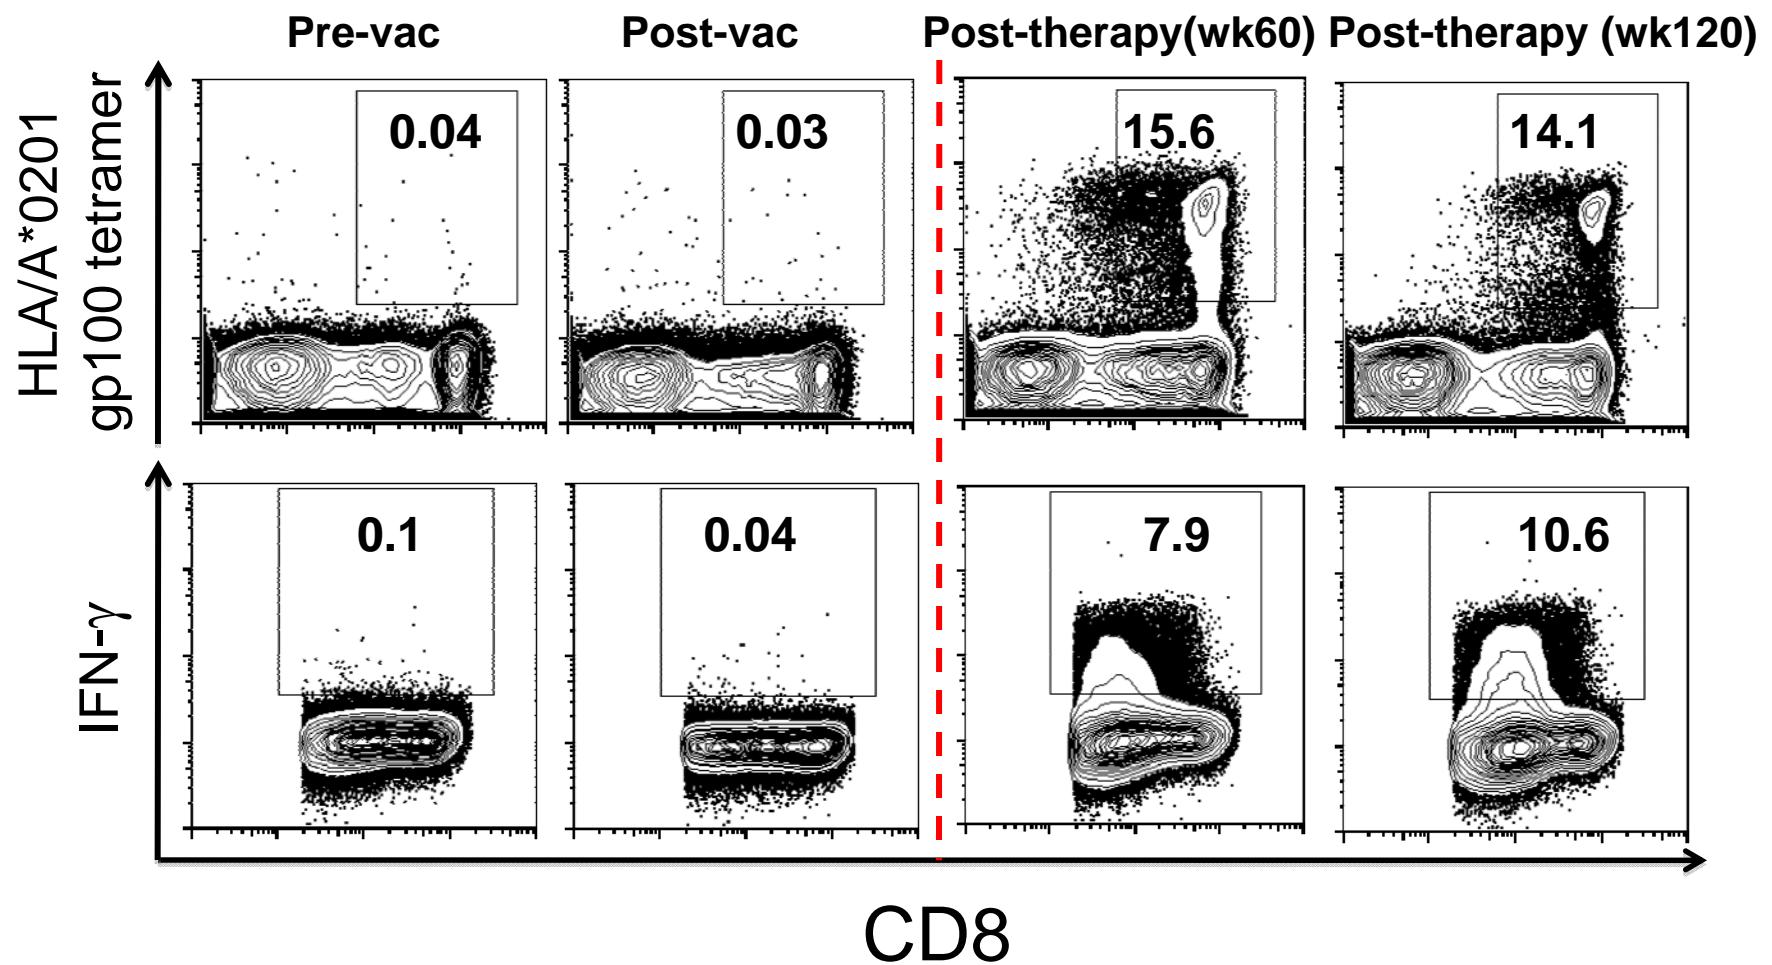

Tyrosinase and gp100 antigen-specific response during GM-CSF DNA and CTLA-4 blockade

Gp100 specific CD8 T-cell response during GM-CSF DNA and CTLA-4 blockade

CD8 gp100²⁰⁹ specific T-cell response during gp100 DNA vaccine and CTLA-4 blockade (patient IMF-24)

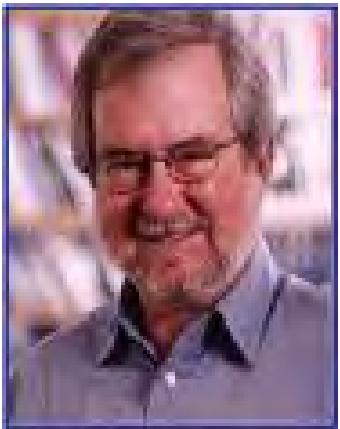

Summary

- CTLA-4 blockade with ipilimumab results in prolonged survival of patients with refractory melanoma.
- Clinical response has been associated with: changes in ALC, NY-ESO-1 immunity and induction of ICOS expression on CD4+ T cells. These require prospective evaluation in ongoing clinical trials.
- De novo immune responses to self antigens has been manifest by autoimmune hypopigmentation.
- Tumor microenvironment is fertile ground to study the mechanism underlying immunologic checkpoint blockade.
