# The long history of cancer immunotherapy

New York Times - July 29, 1908

## **ERYSIPELAS GERMS AS CURE FOR CANCER**

**Dr. Coley's Remedy of Mixed  
Toxins Makes One Disease  
Cast Out the Other.**

**MANY CASES CURED HERE**

**Physician Has Used the Cure for 15  
Years and Treated 430 Cases—  
Probably 150 Sure Cures.**

Following news from St. Louis that two men have been cured of cancer in the City Hospital there by the use of a fluid discovered by Dr. William B. Coley of New York, it came out yester-

# Chemotherapy- “20<sup>th</sup> century medicine” in melanoma

Fig 1. Kaplan-Meier survival plot of all 240 patients randomized based on intent to treat. Median survival time on Dartmouth regimen was 7.7 months (95% CI, 6.3 to 8.9 months) versus 6.3 months (95% CI, 5.4 to 8.7 months) on dacarbazine ( $P = .52$ ). Tick marks represent censored patients.

Chapman et al, “Phase III multicenter randomized trial of the Dartmouth regimen versus dacarbazine in metastatic melanoma,” *Journal of Clinical Oncology*, 1999.

# From: **Association of Pembrolizumab With Tumor Response and Survival Among Patients With Advanced Melanoma**

JAMA. 2016;315(15):1600-1609. doi:10.1001/jama.2016.4059

## Figure Legend:

Progression-Free and Overall Survival in Patients Treated With Pembrolizumab in Total and Treatment-Naive Populations The small vertical tick marks represent patients who were censored at that specific time in the survival analysis. Tick marks appear to be floating when multiple events occurred at the same time. Data were assessed by independent central review using RECIST v1.1.

Chemotherapy is a poison. Purpose is to kill cancer cells more quickly than normal cells.

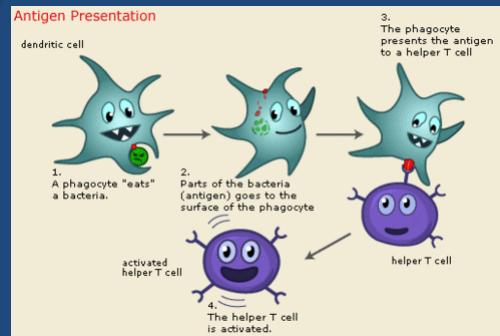

# Comparison of Mechanisms of Cancer Chemotherapy and Cancer Immunotherapy

Chemotherapy

Immunotherapy

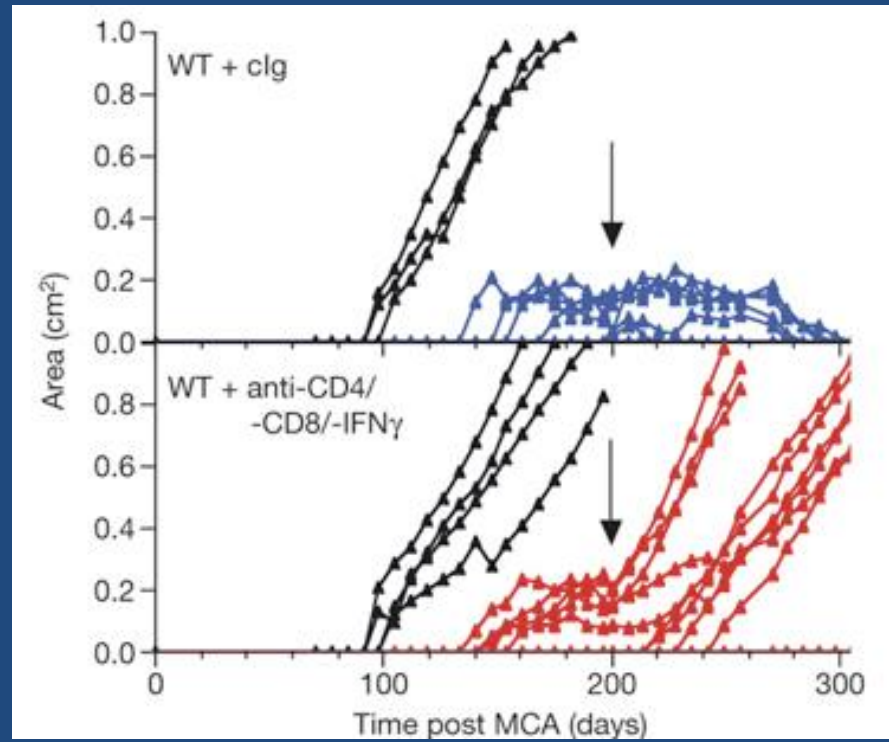

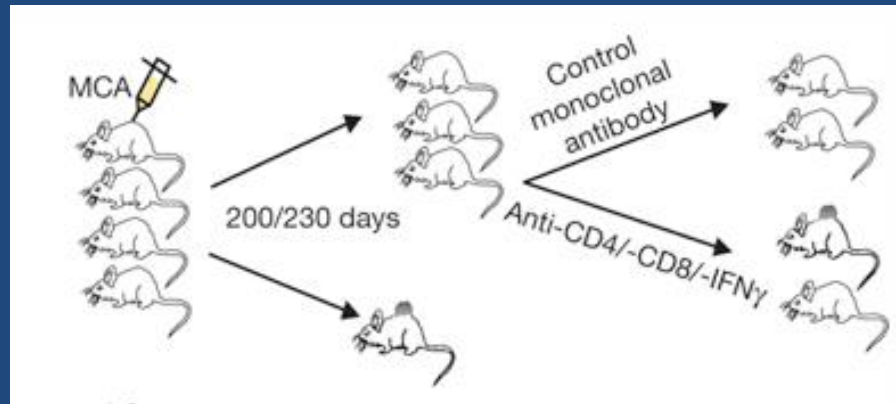

# Immunosurveillance

**WAKE UP!**

Dunn et al., "Cancer immunoediting: from immunosurveillance to tumor escape"  
*Nature Immunology* 2002.

# Immune surveillance controls dormant tumors

Why does the immune system eventually fail to control cancer in some patients?

# Problem #1- The tumor looks like normal tissue

# Mutational profiles of tumor types- in general tumors with more mutations look less like “self”

**Fig. 2. Estimate of the neoantigen repertoire in human cancer.** Data depict the number of somatic mutations in individual tumors. Categories on the right indicate current estimates of the likelihood of neoantigen formation in different tumor types. Adapted from (50). It is possible that the immune system in melanoma patients picks up on only a fraction of the available neoantigen repertoire, in which case the current analysis will be an underestimate. A value of 10 somatic mutations per Mb of coding DNA corresponds to ~150 nonsynonymous mutations within expressed genes.

# Problem #2- Tumors turn off the immune system

# How Does Immunotherapy Work?

Tumor cells bind to T-cells  
to deactivate them

# Talimogene laherparepvec (TVEC)

Talimogene laherparepvec (JS1/ICP34.5-/ICP47-/hGM-CSF)

HSV: Herpes simplex virus; ICP: Infected cell protein; CMV: Cytomegalovirus promoter

- Derived from HSV-1 (cultured from human cold sores)
- Genetically modified to eliminate neurotropism and enhance oncolysis
  - Elimination of neurovirulence factor ICP34.5
  - Elimination of antigen-presentation blocker ICP47
  - Insertion of hGM-CSF (cytokine that recruits immune cells, specifically antigen presenting cells)

<sup>1</sup> Liu BL, et al. *Gene Therapy*. 2003;10:292-303.

# Method of Administration

Lesion size (diameter)	T-VEC injection volume
> 5.0 cm	≤ 4.0 mL
> 2.5 cm to 5.0 cm	≤ 2.0 mL
> 1.5 cm to 2.5 cm	≤ 1.0 mL
> 0.5 cm to 1.5 cm	≤ 0.5 mL
≤ 0.5 cm	≤ 0.1 mL
This total dose administered in any one treatment session should not exceed 4.0 mL	

# T-VEC Responses in Injected And Uninjected Lesions

## Cycle 1

## Cycle 13

# Responding tumors can grow before they shrink

Saenger and Wolchok, "The heterogeneity of the kinetics of response to ipilimumab in metastatic melanoma: patient cases," *Cancer Immunity* 2008

# Kinetics of response may be unpredictable- Immune Related Response Criteria

**Table 1.** Comparison between WHO criteria and the irRC

	WHO	irRC
New, measurable lesions (i.e., $\geq 5 \times 5$ mm)	Always represent PD	Incorporated into tumor burden
New, nonmeasurable lesions (i.e., $< 5 \times 5$ mm)	Always represent PD	Do not define progression (but preclude irCR)
Non-index lesions	Changes contribute to defining BOR of CR, PR, SD, and PD	Contribute to defining irCR (complete disappearance required)
CR	Disappearance of all lesions in two consecutive observations not less than 4 wk apart	Disappearance of all lesions in two consecutive observations not less than 4 wk apart
PR	$\geq 50\%$ decrease in SPD of all index lesions compared with baseline in two observations at least 4 wk apart, in absence of new lesions or unequivocal progression of non-index lesions	$\geq 50\%$ decrease in tumor burden compared with baseline in two observations at least 4 wk apart
SD	50% decrease in SPD compared with baseline cannot be established nor 25% increase compared with nadir, in absence of new lesions or unequivocal progression of non-index lesions	50% decrease in tumor burden compared with baseline cannot be established nor 25% increase compared with nadir
PD	At least 25% increase in SPD compared with nadir and/or unequivocal progression of non-index lesions and/or appearance of new lesions (at any single time point)	At least 25% increase in tumor burden compared with nadir (at any single time point) in two consecutive observations at least 4 wk apart

# Autoimmune toxicities are common

**Table 3. Adverse Events.\***

Event	Nivolumab (N = 313)		Nivolumab plus Ipilimumab (N = 313)		Ipilimumab (N = 311)	
	Any	Grade 3 or 4	Any	Grade 3 or 4	Any	Grade 3 or 4
	<i>number of patients with event (percent)</i>					
Any adverse event	311 (99.4)	136 (43.5)	312 (99.7)	215 (68.7)	308 (99.0)	173 (55.6)
Treatment-related adverse event†	257 (82.1)	51 (16.3)	299 (95.5)	172 (55.0)	268 (86.2)	85 (27.3)
Diarrhea	60 (19.2)	7 (2.2)	138 (44.1)	29 (9.3)	103 (33.1)	19 (6.1)
Fatigue	107 (34.2)	4 (1.3)	110 (35.1)	13 (4.2)	87 (28.0)	3 (1.0)
Pruritus	59 (18.8)	0	104 (33.2)	6 (1.9)	110 (35.4)	1 (0.3)
Rash	81 (25.9)	2 (0.6)	126 (40.3)	15 (4.8)	102 (32.8)	6 (1.9)
Nausea	41 (13.1)	0	81 (25.9)	7 (2.2)	50 (16.1)	2 (0.6)
Pyrexia	18 (5.8)	0	58 (18.5)	2 (0.6)	21 (6.8)	1 (0.3)
Decreased appetite	34 (10.9)	0	56 (17.9)	4 (1.3)	39 (12.5)	1 (0.3)
Increase in alanine amino- transferase level	12 (3.8)	4 (1.3)	55 (17.6)	26 (8.3)	12 (3.9)	5 (1.6)
Vomiting	20 (6.4)	1 (0.3)	48 (15.3)	8 (2.6)	23 (7.4)	1 (0.3)
Increase in aspartate amino- transferase level	12 (3.8)	3 (1.0)	48 (15.3)	19 (6.1)	11 (3.5)	2 (0.6)
Hypothyroidism	27 (8.6)	0	47 (15.0)	1 (0.3)	13 (4.2)	0
Colitis	4 (1.3)	2 (0.6)	37 (11.8)	24 (7.7)	36 (11.6)	27 (8.7)
Arthralgia	24 (7.7)	0	33 (10.5)	1 (0.3)	19 (6.1)	0
Headache	23 (7.3)	0	32 (10.2)	1 (0.3)	24 (7.7)	1 (0.3)
Dyspnea	14 (4.5)	1 (0.3)	32 (10.2)	2 (0.6)	13 (4.2)	0
Treatment-related adverse event leading to discontinuation	24 (7.7)	16 (5.1)	114 (36.4)	92 (29.4)	46 (14.8)	41 (13.2)

\* The safety population included all the patients who received at least one dose of study drug. The severity of adverse events was graded according to the National Cancer Institute Common Terminology Criteria for Adverse Events, version 4.0.

† The treatment-related adverse events listed here were those reported in at least 10% of the patients in any of the three study groups.

Larkin et al, "Combined Nivolumab and Ipilimumab or Monotherapy in Untreated Melanoma," *NEJM* 2015

Kinetics of toxicities are unpredictable- Auto-immune vitiligo appearing in injected area in patient 1 year following completion of therapy with anti-CTLA4 combined with T-vec

Why doesn't immunotherapy always  
work?

The immune system has traitors in its midst.

Tumor associated macrophage- cells that can prevent T cells from entering tumors.

# What to expect with immunotherapy

- Little if any toxicity of the infusion itself. Patients receiving T-vec may develop rigors or mild inflammatory symptoms.
- Auto-immune disease may develop over weeks to months to years
- Immunotherapy can take a little longer to work

# Duration of Response<sup>a</sup>

PRESENTED AT: **ASCO ANNUAL MEETING '16**

*Slides are the property of the author. Permission required for reuse.*

<sup>a</sup>Assessed per RECIST v1.1 by independent central review in patients with response, regardless of centrally evaluable disease at baseline. <sup>b</sup>Responders who were alive without disease progression or new anticancer therapy. Analysis cutoff date: Sep 18, 2015.

# SUMMARY: KEY GENERAL PRINCIPLES

- We all have innate immune responses against cancer
- Some cancers are able to hide from the immune system in part because cancer cells are so similar to normal cells
- Immunotherapy “wakes up” T cells against the cancer
- It can also “wake up” T cells against normal tissues causing autoimmune disease
- Anti-PD1 is the most effective immunotherapy and it acts by taking the breaks of T cells
- The first oncolytic virus was recently approved in cancer
- Many new treatments are showing great promise and will be approved soon particularly treatments targetting macrophages

## SUMMARY: KEY CLINICAL IMPLICATIONS

- Immunotherapy does not cause the “poison” effects of chemotherapy
- Immunotherapy does cause autoimmune disease and this can be life threatening
- Immunotherapy generally produces more durable benefit than chemotherapy when it works
- Immunotherapy cures a minority of patients even in melanoma
- Immunotherapy can take longer to work and there can be a period of disease growth before response is seen, possibly due to inflammation
- Patients who have received immunotherapy may develop auto-immunity after treatment is completed
