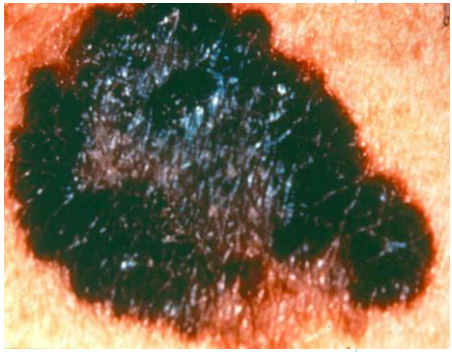
Melanoma: Where are we?
2014 ACS Incidence Predictions

139,870 new cases of melanoma in the US predicted for 2014



- **76,100 invasive cases**
- **5,320 cases predicted in Florida***
- 63,770 noninvasive cases (melanoma in situ)
- 9,710 deaths predicted for US in 2014

* Second-most cases of any state in the US after California, (8,440 cases); New York third (4,240 cases)

Siegel et al, CA Cancer J Clin 2014;64:9

Melanoma: Where are we going? Future Incidence Predictions

76,100 new cases of invasive melanoma in the US predicted for 2014

- **2020:** 111,000 invasive cases **+34,900**
- **2030:** 151,000 invasive cases **+74,900**
  - Fifth most common cancer behind breast (294,000), prostate (228,000), lung (225,000), and **thyroid** (183,000)

+ = increase compared to 2014 predictions

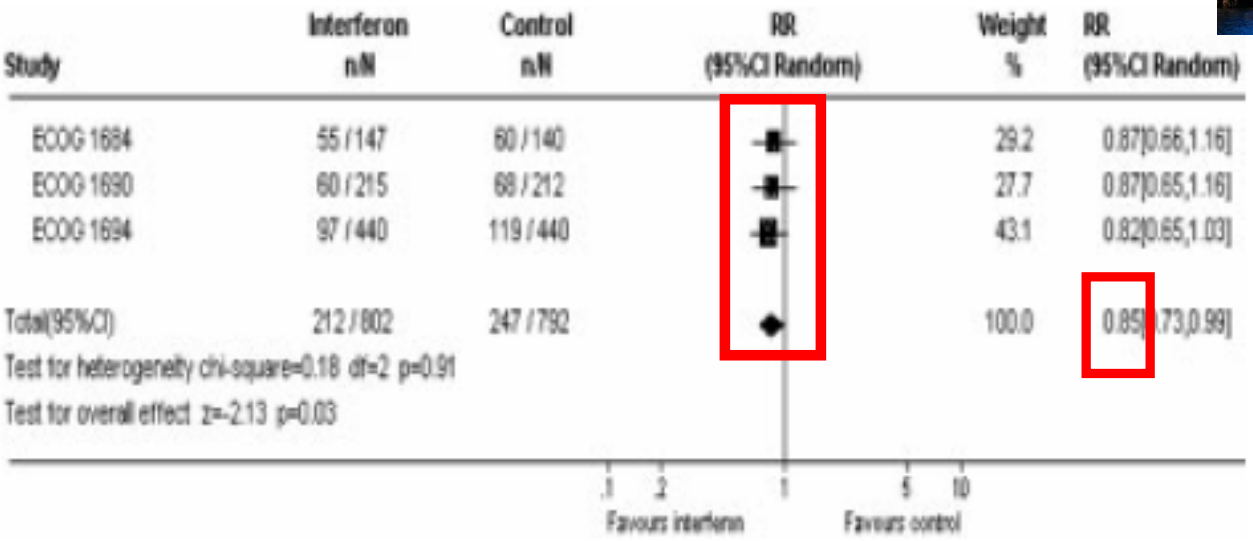
Favours IFN Favours control

Adjuvant interferon (various doses and durations) improved relapse-free survival in almost every study

17% increase, p<0.00001

Mocellin et al, Cochrane Database of Systemic Reviews 2013;DOI10.1002/14651858

Meta-analysis of high-dose interferon impact on survival at 2 years



High dose interferon for one year significantly improved survival at two years

(15% increase, p=0.03)

Verma et al Cancer 2006;106:1431

What difference does a few years make?

Chemotherapy	Immunotherapy	Targeted Therapy
Dacarbazine (DTIC) (FDA approved 1975)	Interleukin-2 (FDA approved 1998)	**Vemurafenib** (FDA approved 2011)
Temozolomide*	High-dose Interferon (FDA approved 1995)	**Dabrafenib** (FDA approved 2013)
Carboplatin/Paclitaxel*	**PEG-Interferon** (FDA approved 2011)	**Trametinib** (FDA approved 2013)
	Ipilimumab (FDA approved 2011)	**Dabrafenib+Trametinib** (FDA approved 2014)
	Pembrolizumab (accelerated approval for refractory disease 2014)	Imatinib*
Biochemotherapy* (Cisplatin, DTIC, Vinblastine, IL2, IFN)		

*Off-label use of FDA approved drug(s)

New melanoma drugs approved in past 3 years

ADJUVANT THERAPY OF MELANOMA

Where have we been?

We can delay recurrence with high-dose interferon, but at what cost?

Toxicity is high

Treatment is for a year

Interferon management recommendations

Society for Immunotherapy of Cancer consensus statement on tumour immunotherapy for cutaneous melanoma

Management issue: Treatment of interferon-α2b-related depression

- Can be a significant adverse effect of therapy
- Special attention to history of depression and related disorders before treatment is warranted
- Major depression is a relative contraindication to treatment
- The majority consensus opinion was to use antidepressants in selected patients who develop depression during therapy (45.5%)
- A large minority opinion suggested prophylactic antidepressants should be started at the time of treatment initiation in all patients (31.8%)
- A minority of the panel recommended referral to a psychologist before starting treatment for all patients (13.6%)
- A minority of the panel recommended selective referral to a psychologist only if and when symptoms develop (13.6%)
- Some panel members suggested both antidepressants and psychology referral should be considered

Outcome

evidence

First recu

Death

Until better selection methods or more effective therapies are available, the findings of the present meta-analysis lend support to the use of interferon in the routine clinical setting to provide patients with the best chance of survival. Moreover, we must remember that other well-established adjuvant treatments, such as those routinely administered to people with breast, colorectal, and ovarian carcinomas, are associated with risk reductions very similar to those found in this meta-analysis for those with high-risk melanoma treated with interferon (Ascierto 2008). Therefore, the need for better therapeutic strategies is an urgent issue for virtually all tumour types.

Mocellin et al, Cochrane Database of Systemic Reviews 2013;DOI10.1002/14651858

Why would there be a RFS benefit without OS improvement?

- **Crossover effect**
  - Currently relevant for E1690 only
  - Likely to significantly impact adjuvant trials of ipilimumab, targeted therapy
- **Delayed recurrence by elimination of "nonlethal" tumor cells**
- **Rescue or salvage therapy**

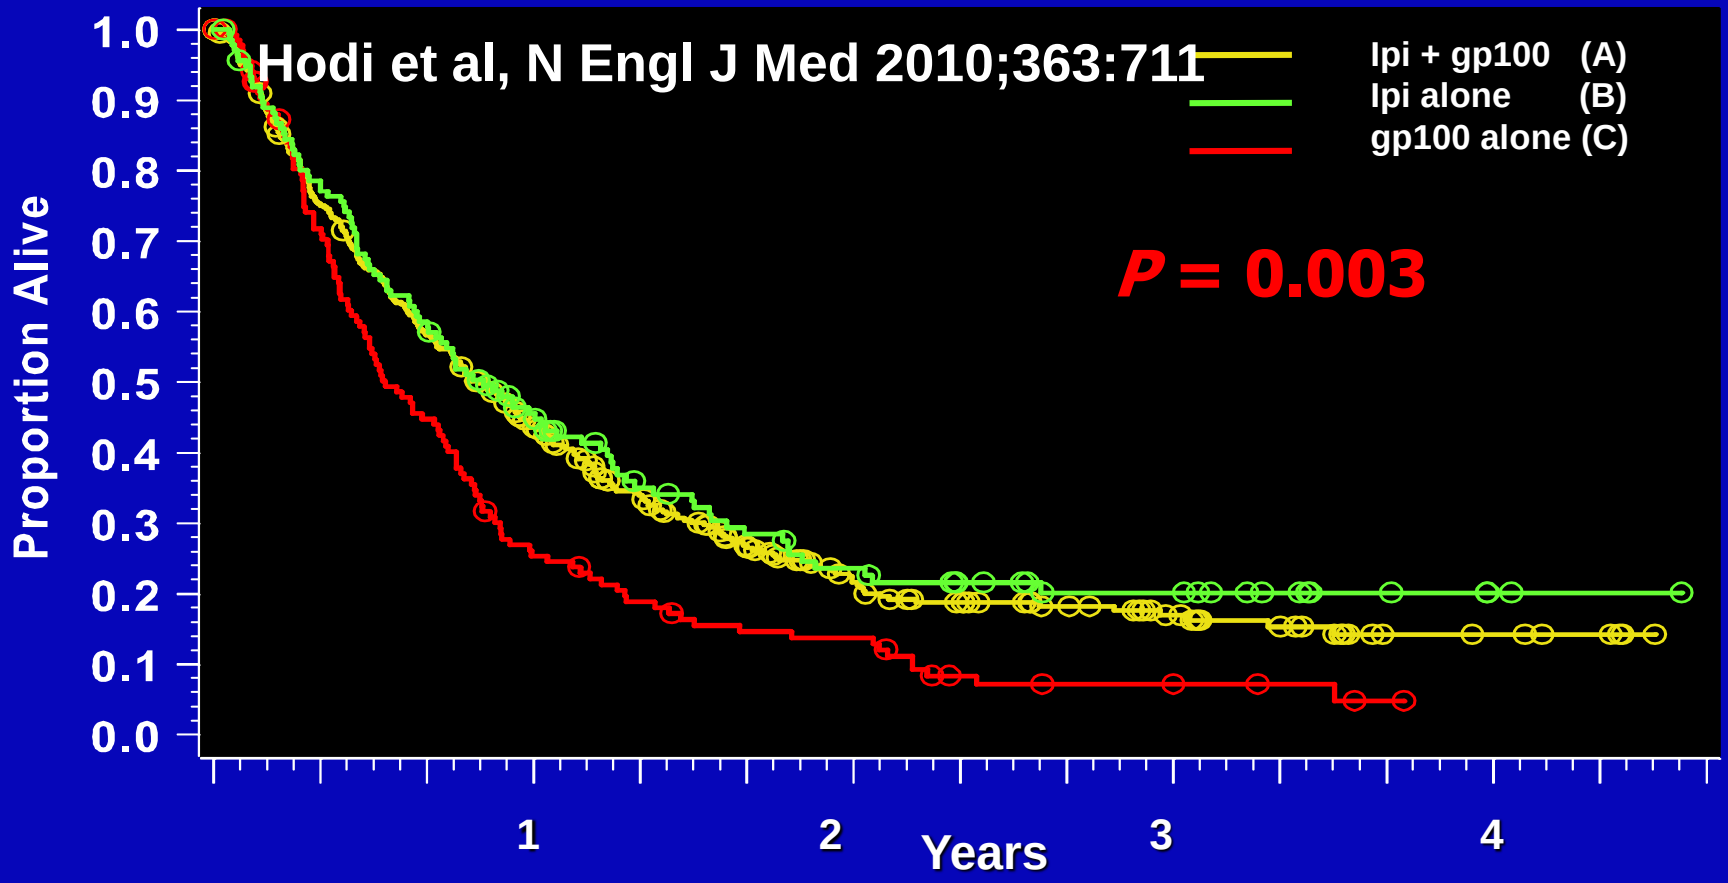
Rescue or Salvage?

Where are we going?

Can we use the new active agents for treating metastatic melanoma to improve survival in the adjuvant setting?

Ipilimumab

Ipilimumab (3 mg/kg x 4) Improves Overall Survival in Previously Treated Stage IV Melanoma



Survival Rate	Ipi + gp100 N=403	Ipi + pbo N=137	gp100 + pbo N=136
1 year	44%	46%	25%
2 year	22%	24%	14%

Eggermont et al, Proc ASCO 2014; LBA9008

Fatal Adverse Events

Ipilimumab (10 mg/kg) x 3 years vs placebo

- Five patients (1.1%) died due to drug-related AEs in the ipilimumab group:
  - Three patients with colitis (2 with gastrointestinal perforations)
  - One patient with myocarditis
  - One patient with Guillain-Barré syndrome
- No deaths related to study drug were reported in the placebo group

Eggermont et al, Proc ASCO 2014; LBA9008

Where are we going?

Can we use the new active agents for treating metastatic melanoma to improve survival in the adjuvant setting?

Ipilimumab

E1609 Ipilimumab 10 mg/kg or 3 mg/kg vs high-dose interferon alfa-2b

Study closed to accrual, results not anticipated for several years

Where are we going?

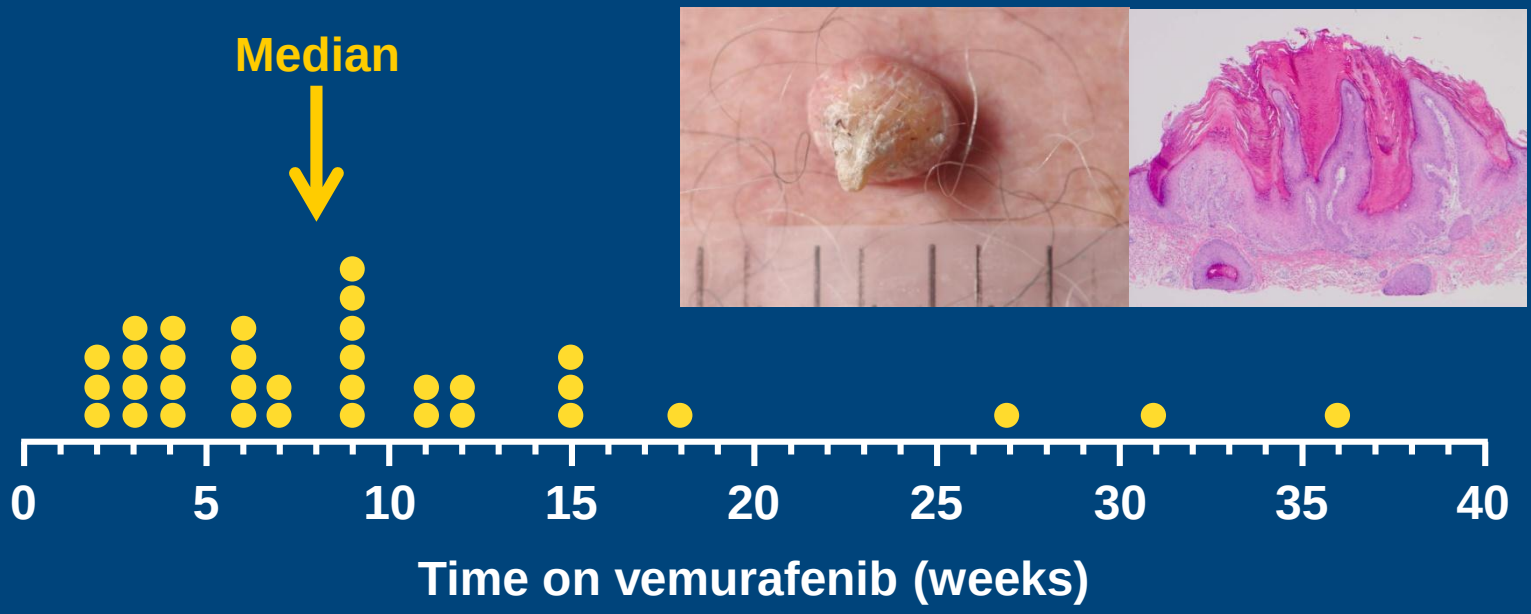
Can we use the new active agents for treating metastatic melanoma to improve survival in the adjuvant setting?

BRAF±MEK inhibitors

Several studies underway, results not anticipated for several years

Adjuvant therapy with BRAF inhibitors

Will second-primary cancers be a limiting factor?



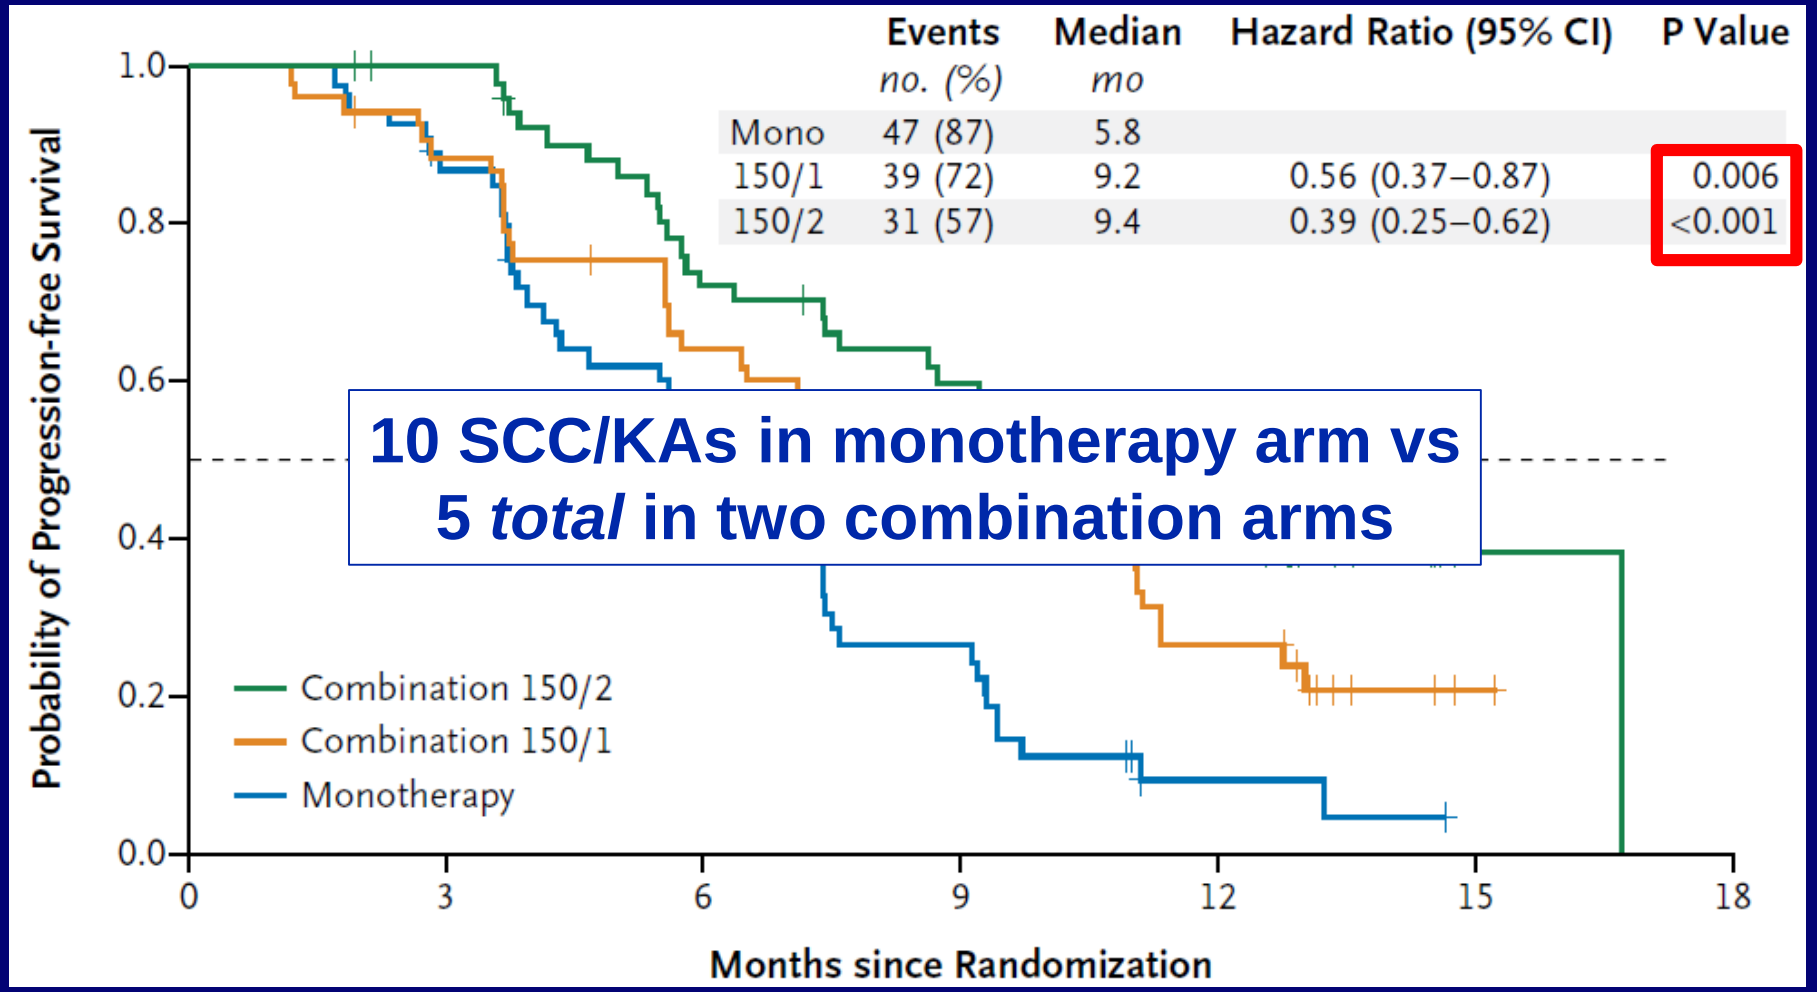
- Median time 8 weeks (range 2–36)
- Each dot represents weeks to development of first lesion

Ribas et al, Proc ASCO 2011; abstract 8509

PRESENTED AT: ASCO Annual '11 Meeting

Adjuvant therapy with BRAF+MEK inhibitors

Will development of resistance be a limiting factor?



Flaherty et al, N Engl J Med 2012;367:1694

Where are we going?

Can we use the new active agents for treating metastatic melanoma to improve survival in the adjuvant setting?

Anti-PD1 antibodies

S1404 Pembrolizumab vs high-dose interferon alfa-2b

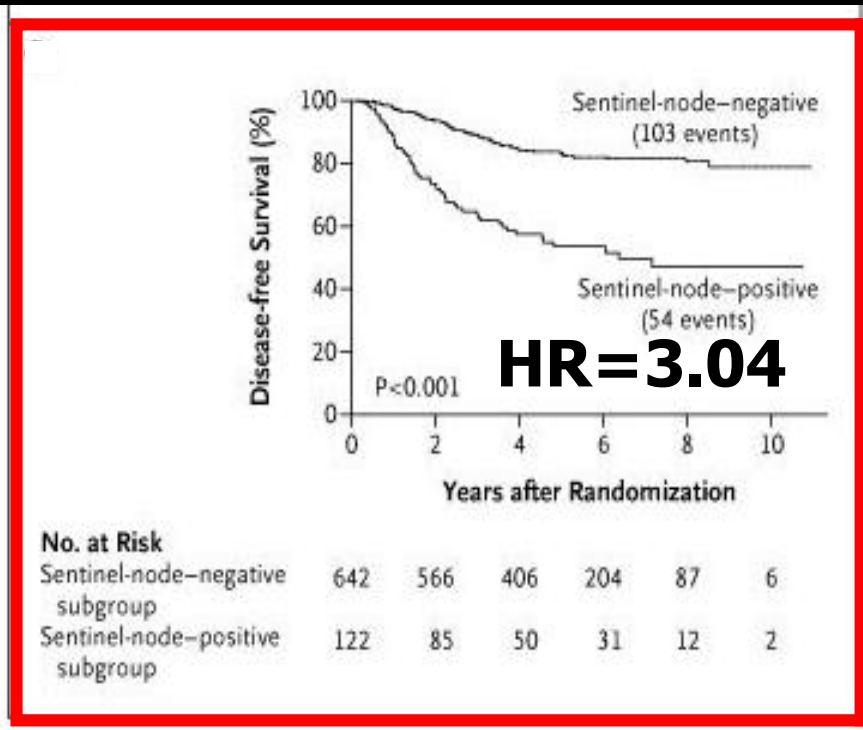
Study anticipated to open January 2015, accrual will take several years

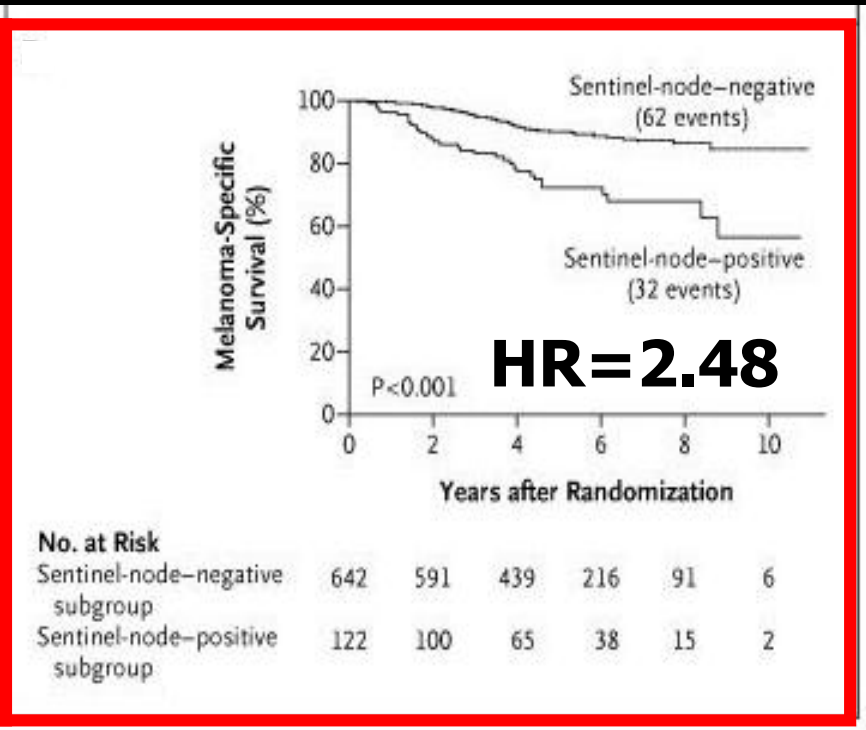
What Do We Need To Get There?

- **We still need better prognostic markers to identify patients at risk of relapse, especially in the sentinel node negative population**

ADJUVANT THERAPY OF MELANOMA

Let's Not Forget The "Low Risk" Groups





Morton D et al. N Engl J Med 2006;355:1307-1317

Sentinel node negative patients outnumber sentinel node positive patients by about 5 to 1

The NEW ENGLAND JOURNAL of MEDICINE

ADJUVANT THERAPY OF MELANOMA
