# IFN $\gamma$ R2- and Jak1-mutant B16.SIY cells do not respond to IFN- $\gamma$ stimulation *in vitro*

What is the behavior of these tumor cells *in vivo*?

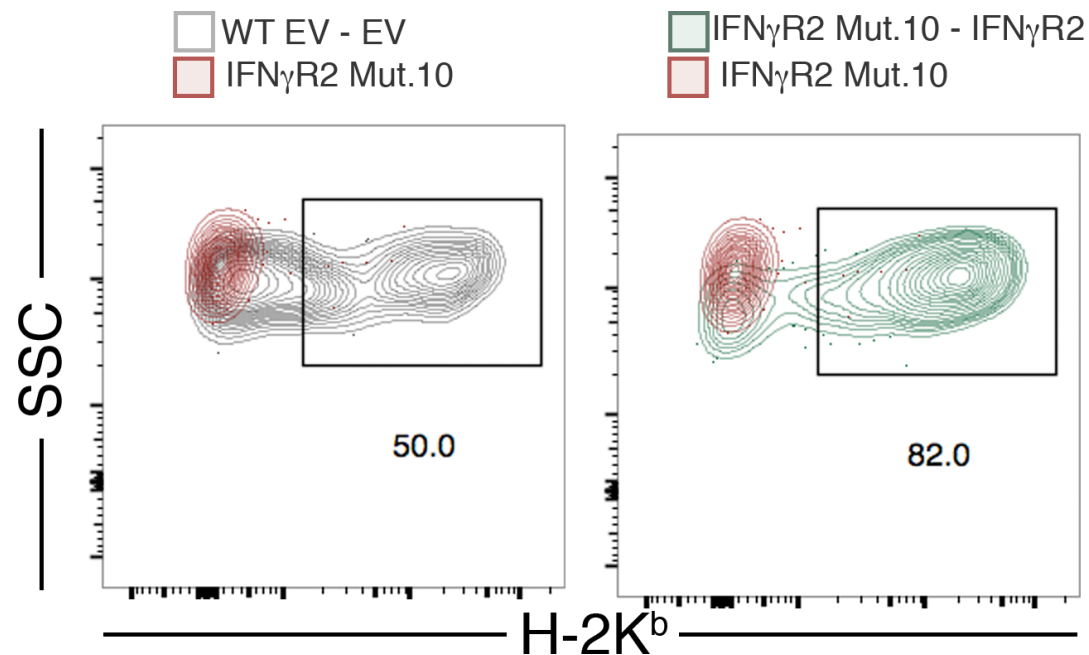

# Paradoxically, IFN $\gamma$ R2- and Jak1-mutant tumors show retarded tumor growth *in vivo*

# Re-introduction of IFN $\gamma$ R2 restores progressive tumor growth *in vivo*

*In vivo*

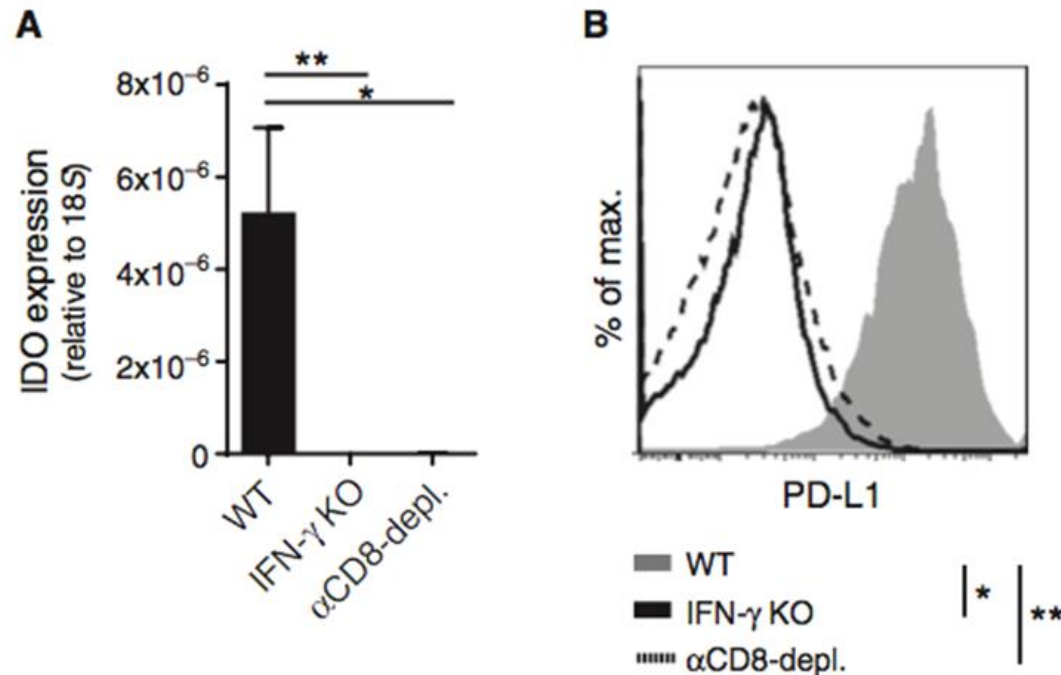

# CD8<sup>+</sup> T cells are required for spontaneous regression of IFN $\gamma$ R2-mutant B16.SIY tumors

# Why might blunted IFN- $\gamma$ signaling in tumor cells lead to improved immune-mediated tumor control *in vivo*?

Spranger S. et al., *Sci. Transl. Med.* 2013

Hypothesis: Tumor cells deficient in IFN- $\gamma$  signaling may fail to upregulate PD-L1, which in some tumor models could be dominant

# Deficient IFN- $\gamma$ signaling in tumor cells leads to lack of PD-L1 upregulation *in vivo*

Sorted Tumor Cells

# Restoration of PD-L1 expression in IFN $\gamma$ R2- and Jak1-mutant tumors is sufficient to restore progressive tumor growth *in vivo*

# Conclusions

- In a genome wide CRISPR screen, tumor cells with mutation in Jak1 or in IFN $\gamma$ R2 arose as resistant to T cell-mediated killing *in vitro*.
- Paradoxically, IFN $\gamma$ R2- and Jak1-mutant tumors were better controlled *in vivo* in two independent tumor models, in a CD8<sup>+</sup> T cell-dependent fashion.
- Re-introduction of IFN $\gamma$ R2 restored progressive tumor growth, proving an on-target effect.
- Mutant tumors failed to upregulate PD-L1 *in vivo*, which likely explained improved immune-mediated tumor control.
- Restoration of PD-L1 expression was sufficient to restore tumor progression, confirming a critical role of PD-L1 on tumor cells in mediating this effect.
- Together, these data imply that while IFN- $\gamma$  can have positive immune effects on tumor cells, in some settings the upregulation of immune-inhibitory molecules such as PD-L1 can dominate leading to tumor progression.

# SIY-specific CD8<sup>+</sup> T cell responses are augmented in the setting of IFN $\gamma$ R- and Jak1-mutant tumors

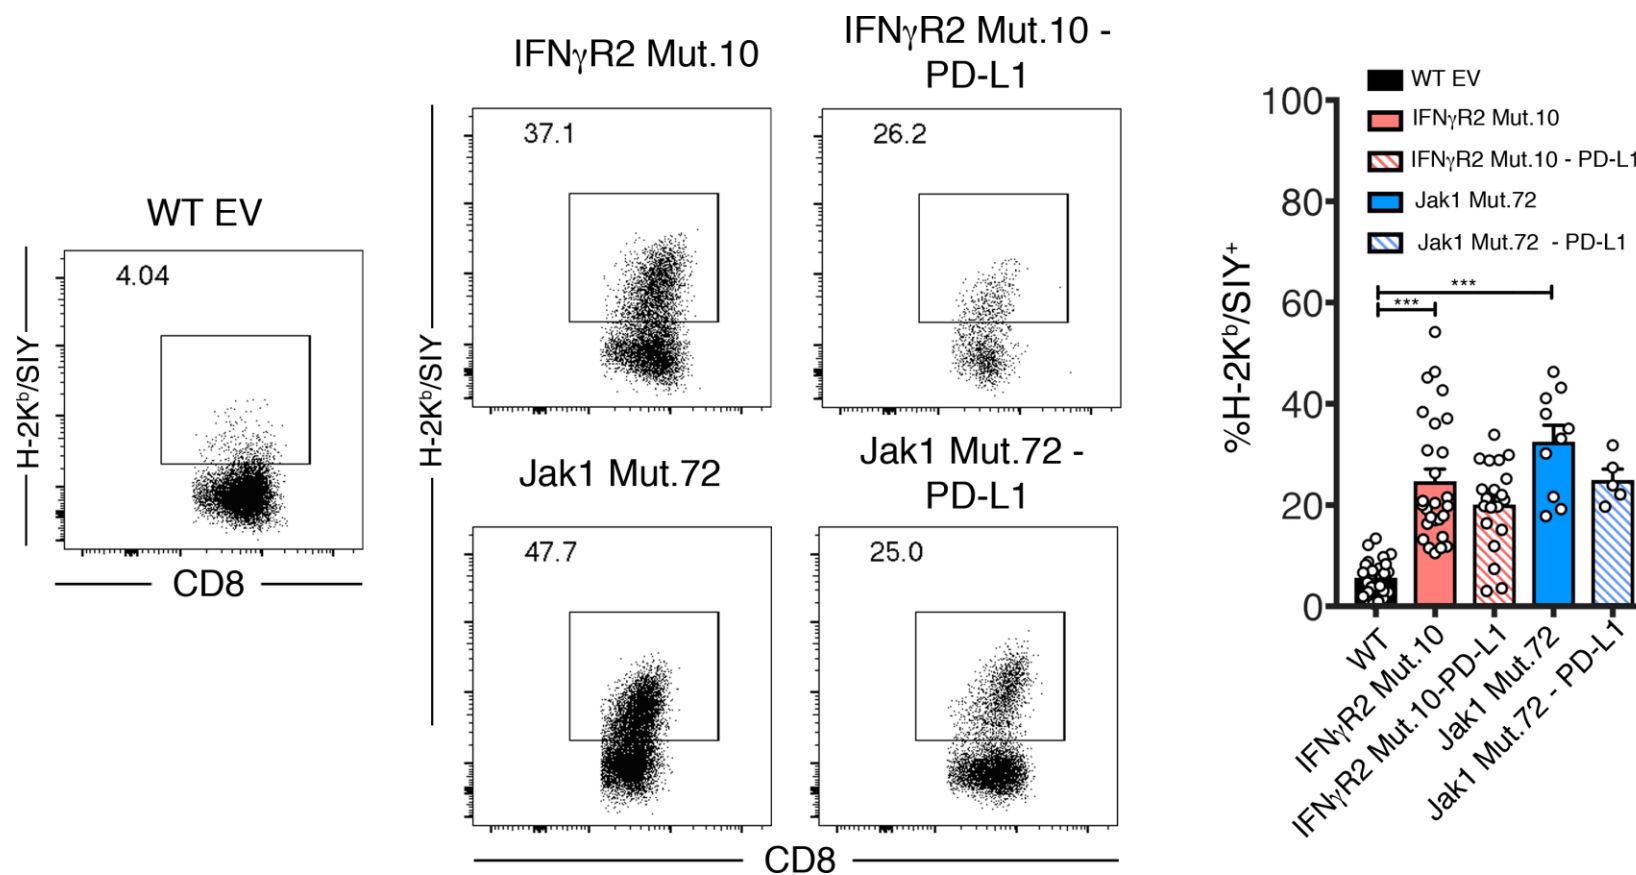

# Restoration of tumor cell-intrinsic IFN- $\gamma$ signaling is sufficient to revert the anti-tumor T cell response to wild-type levels

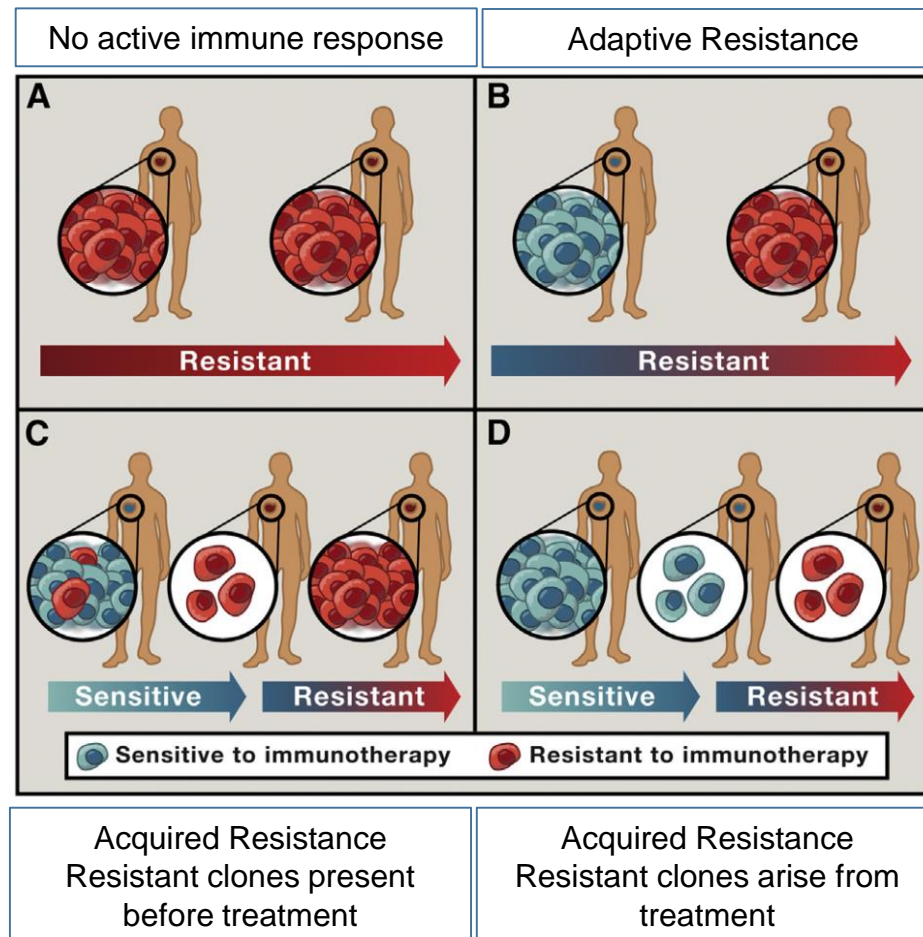

# PD-L1 overexpression does not fully normalize the augmented anti-tumor response against IFN $\gamma$ R2- and Jak1-mutant tumors

# Regulatory T cells are recruited efficiently to IFN $\gamma$ RKO tumors

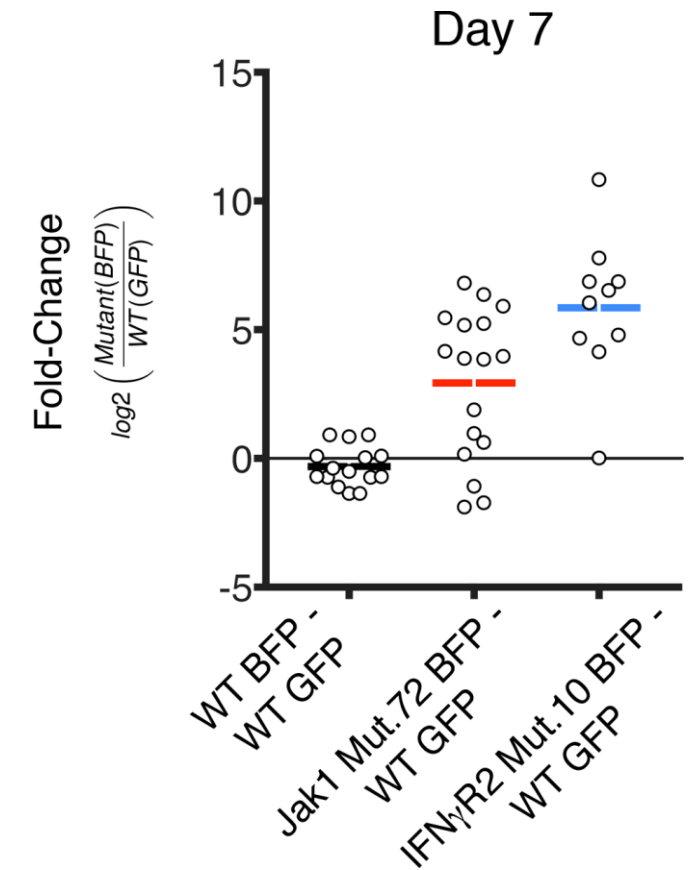

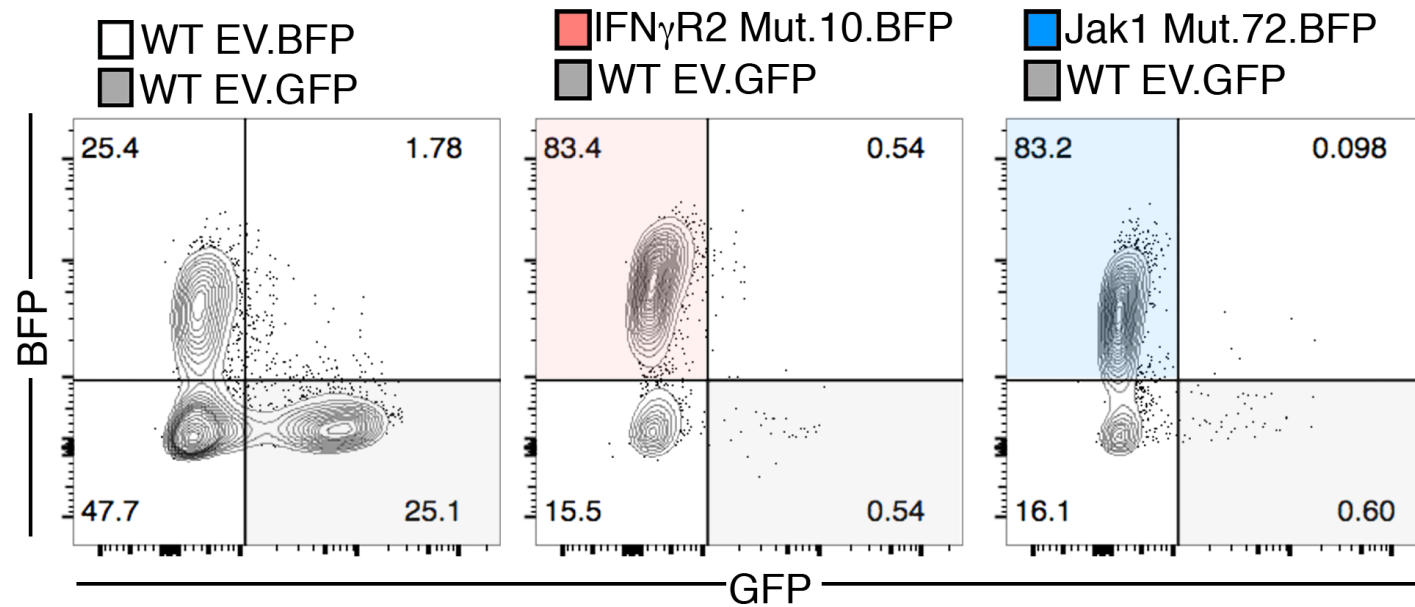

# Clinical scenarios of primary, adaptive, and acquired resistance to immunotherapy

What might occur with a mixture of WT and IFN-pathway mutants?

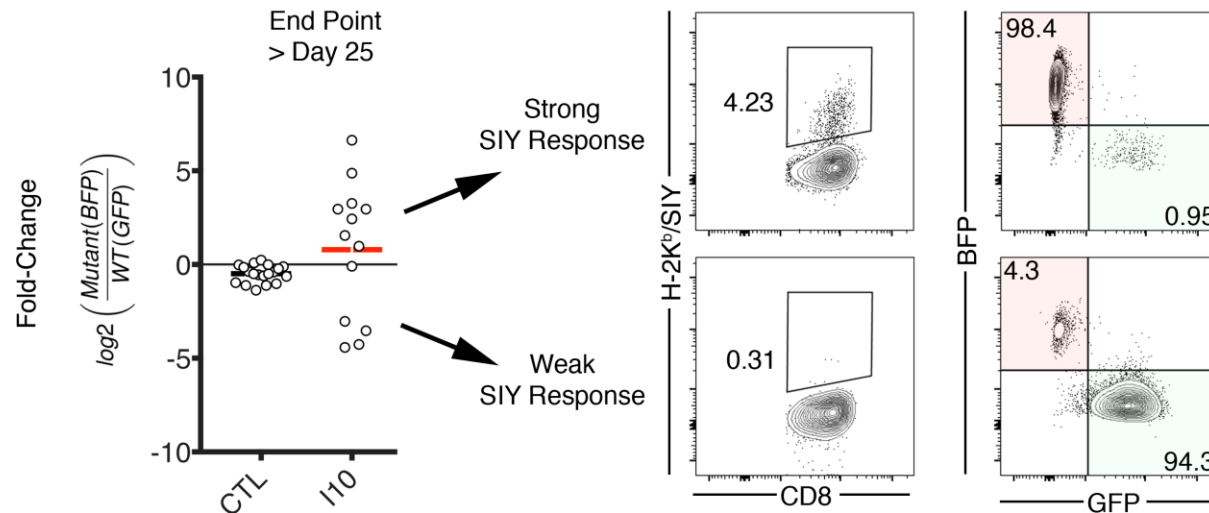

# IFN $\gamma$ R2- and Jak1- mutant tumor cells are selected for in a mixture setting *in vivo*

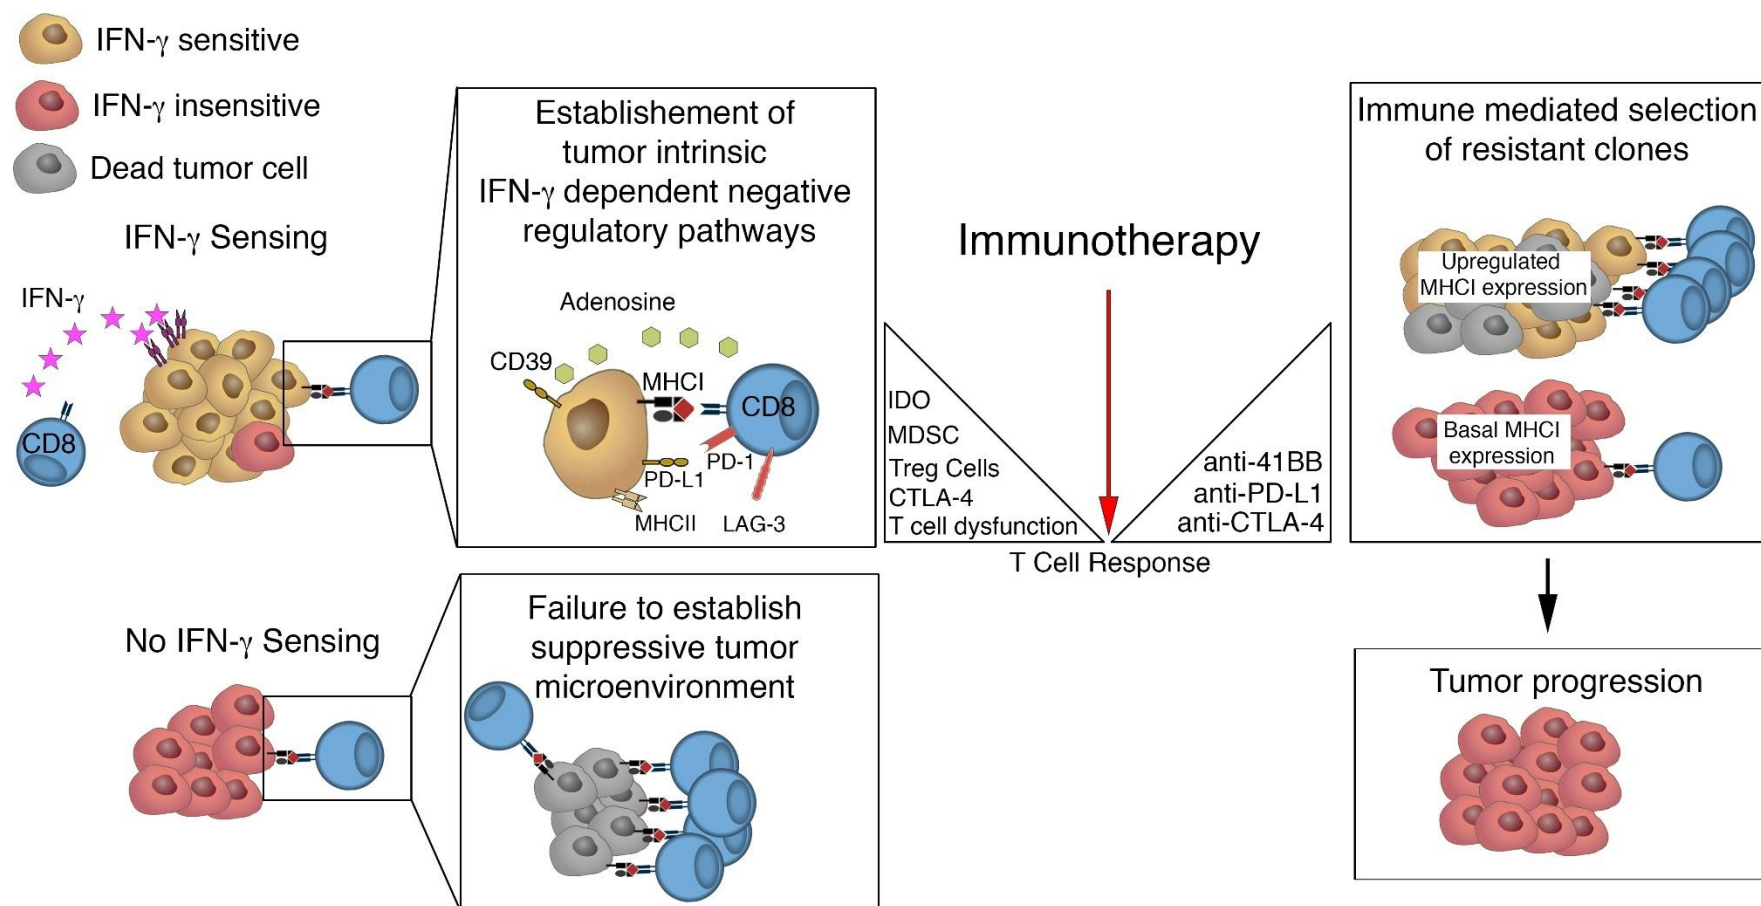

# A strong anti-tumor T cell response correlates with selection of mutant tumors over time

Acquired Resistance

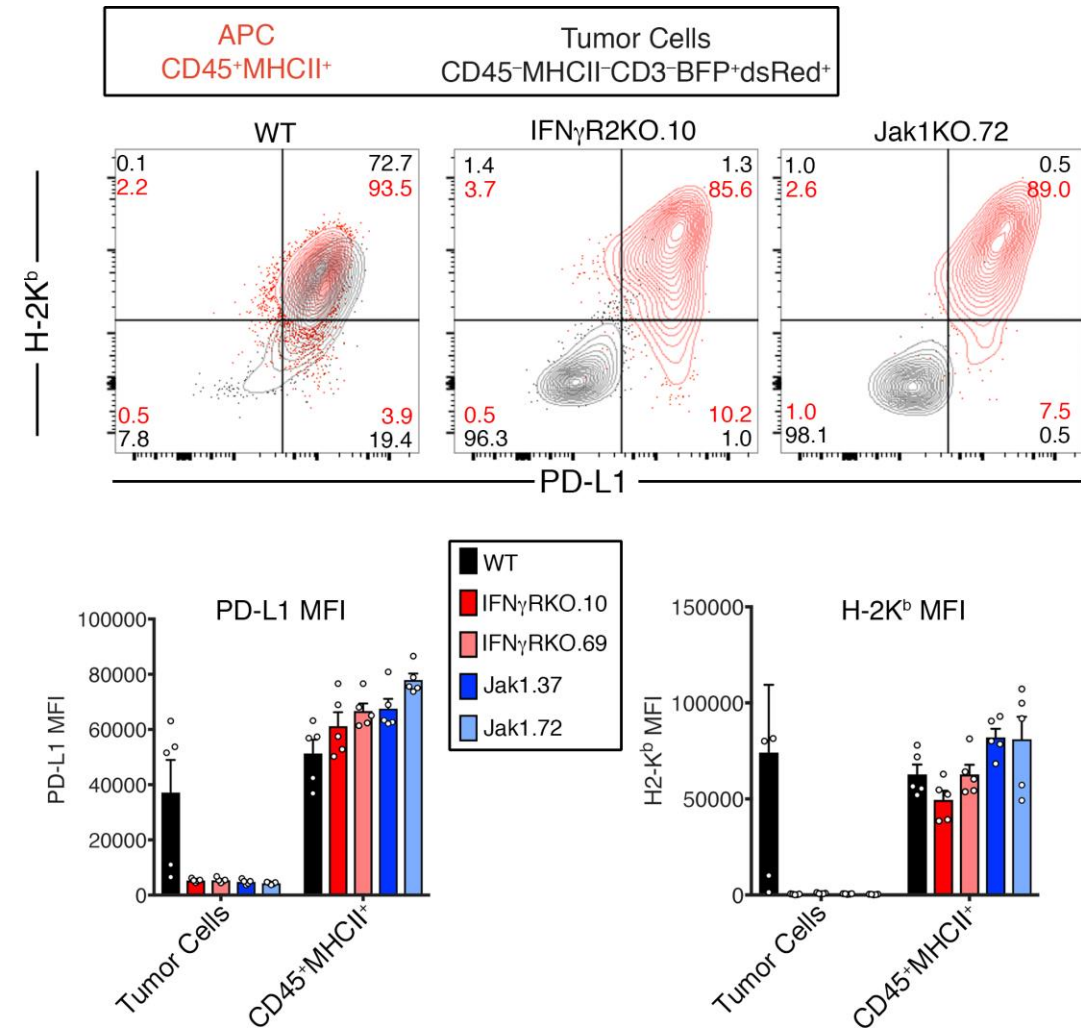

Adaptive Resistance

# Working Model

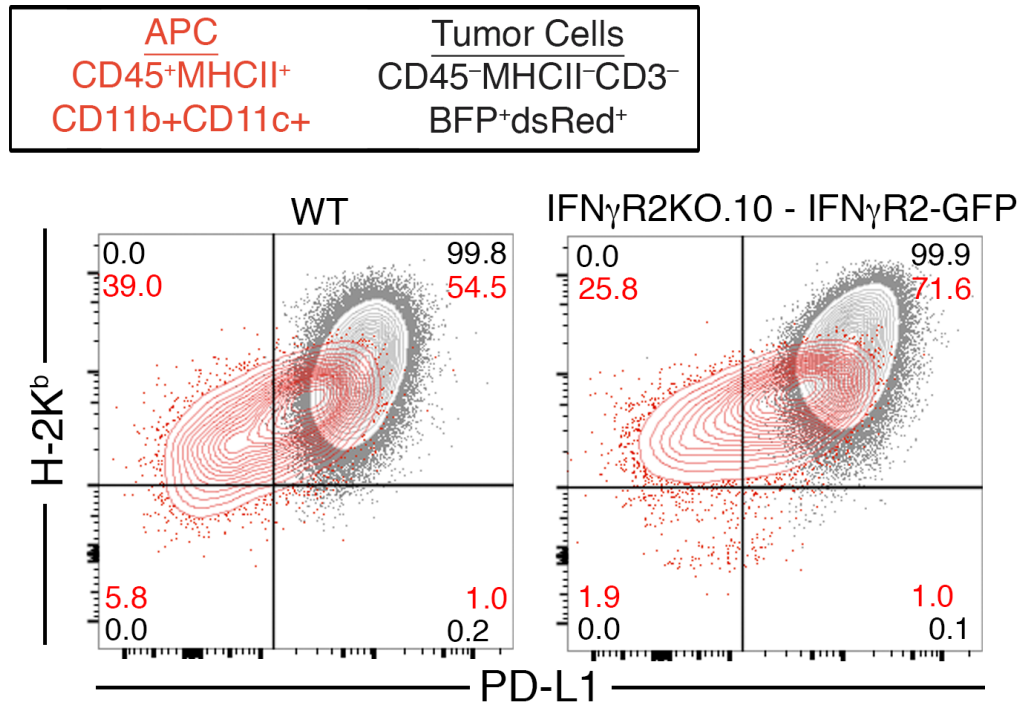

# IFN $\gamma$ R2<sup>-/-</sup> B16.SIY cells fail to upregulate H-2K<sup>b</sup> and PD-L1

In the absence of tumor sensing IFN $\gamma$ , PD-L1, as well as H-2K<sup>b</sup>, are not upregulated.

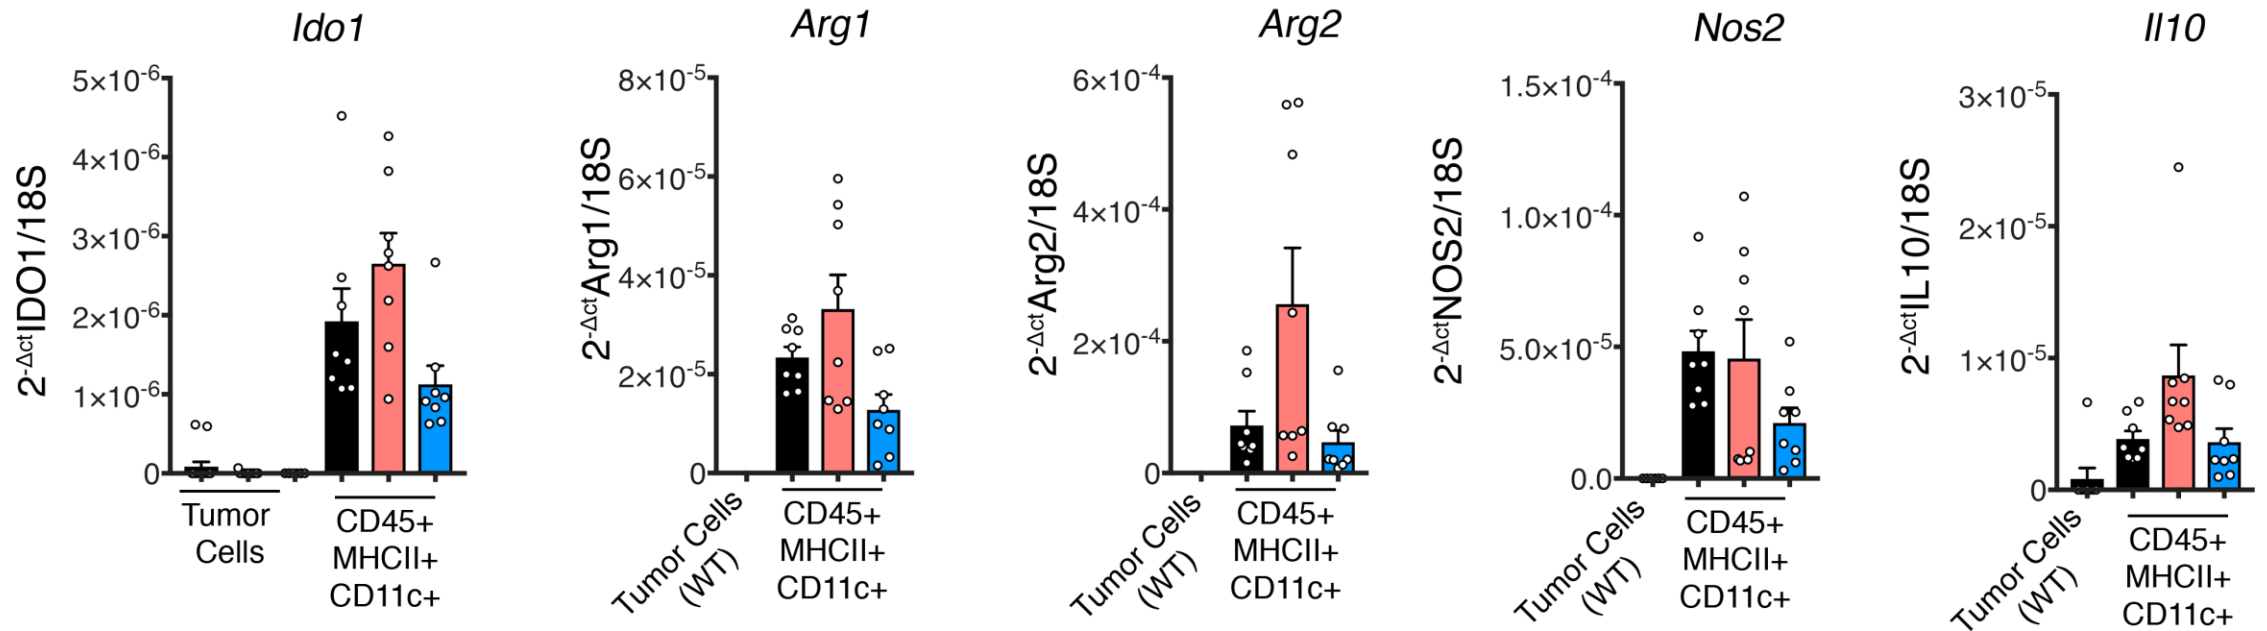

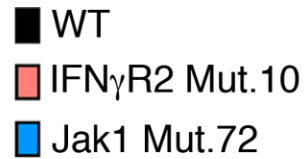

# Reintroduction of IFN $\gamma$ R2 expression in IFN $\gamma$ R2KO tumors is sufficient to restore PD-L1 upregulation

# No substantial difference in CD8<sup>+</sup> effector molecules is observed

# Other potential negative regulators are not substantially different

# Selecting a single B16.SIY clone to normalize starting genetic composition

## Criteria for clone

- Similar dsRed expression to polyclonal population
  - dsRed is a readout for SIY expression
- Tumors Grow progressively
- Tumors respond to checkpoint blockade

# Cell lines were tested negative for mycoplasma

## Mycoplasma Testing by TLR2 Activation

### Subsequent Screen

## Mycoplasma Testing by DAPI Stain

### #9\_Control
