# Immune-related adverse events (irAEs)

- Immune checkpoint inhibitor (ICI) toxicities often have delayed onset and prolonged duration relative to chemotherapy toxicity
- Toxicities result from non-specific activation of the immune system and can mimic a number of other medical conditions

# Onset of irAEs

- Can be days to months after therapy initiation
- May occur even after treatment is discontinued
- Important to identify patients who are currently **OR** previously on ICI treatment!

# Incidence of irAEs

- Overall incidence of all-grade irAEs with single-agent ICI reported as 15-90% in studies
- Anti-CTLA-4 inhibitor (ipilimumab): dose-dependent toxicities
  - Any grade toxicity  $\leq$  75% (**Grade 3+:  $\leq$  43%**)
- PD-1/PD-L1 inhibitors: toxicities less dose-dependent
  - Any grade toxicity  $\leq$  30% (**Grade 3+:  $\leq$  20%**)
- Life-threatening irAEs are rare but treatment-related deaths reported in up to 2% of clinical trial patients

# Incidence of specific irAEs by ICI

Drug	Dermatitis	Colitis	Hepatitis	Endocrinopathies	Pneumonitis
	<b>All grades [%] (grade 3-4)</b>				
Ipilimumab	14.5 (12)	10 (7)	5 (2)	10 (3)	<1
Ipilimumab/Nivolumab	30 (3)	26 (16)	13 (6)	35 (4)	6 (2.2)
Nivolumab	28 (1.5)	2.9 (0.7)	1.8 (0.7)	12 (0)	3.1 (1.1)
Pembrolizumab	20 (0.5)	1.7 (1.1)	0.7 (0.4)	12.5 (0.3)	3.4 (1.3)
Atezolizumab	17 (0.8)	1 (<1)	1.3 (<1)	5.9 (<1)	2.6 (<1)
Avelumab	15 (0.4)	1.5 (0.4)	0.9 (0.7)	6.5 (0.3)	1.2 (0.5)
Durvalumab	11 (1)	1.3 (0.3)	1.1 (0.6)	16.2 (0.1)	2.3 (0.5)

# Severity of irAEs by ICI

# Fatal Events with ICI

## C Cases and fatality rates

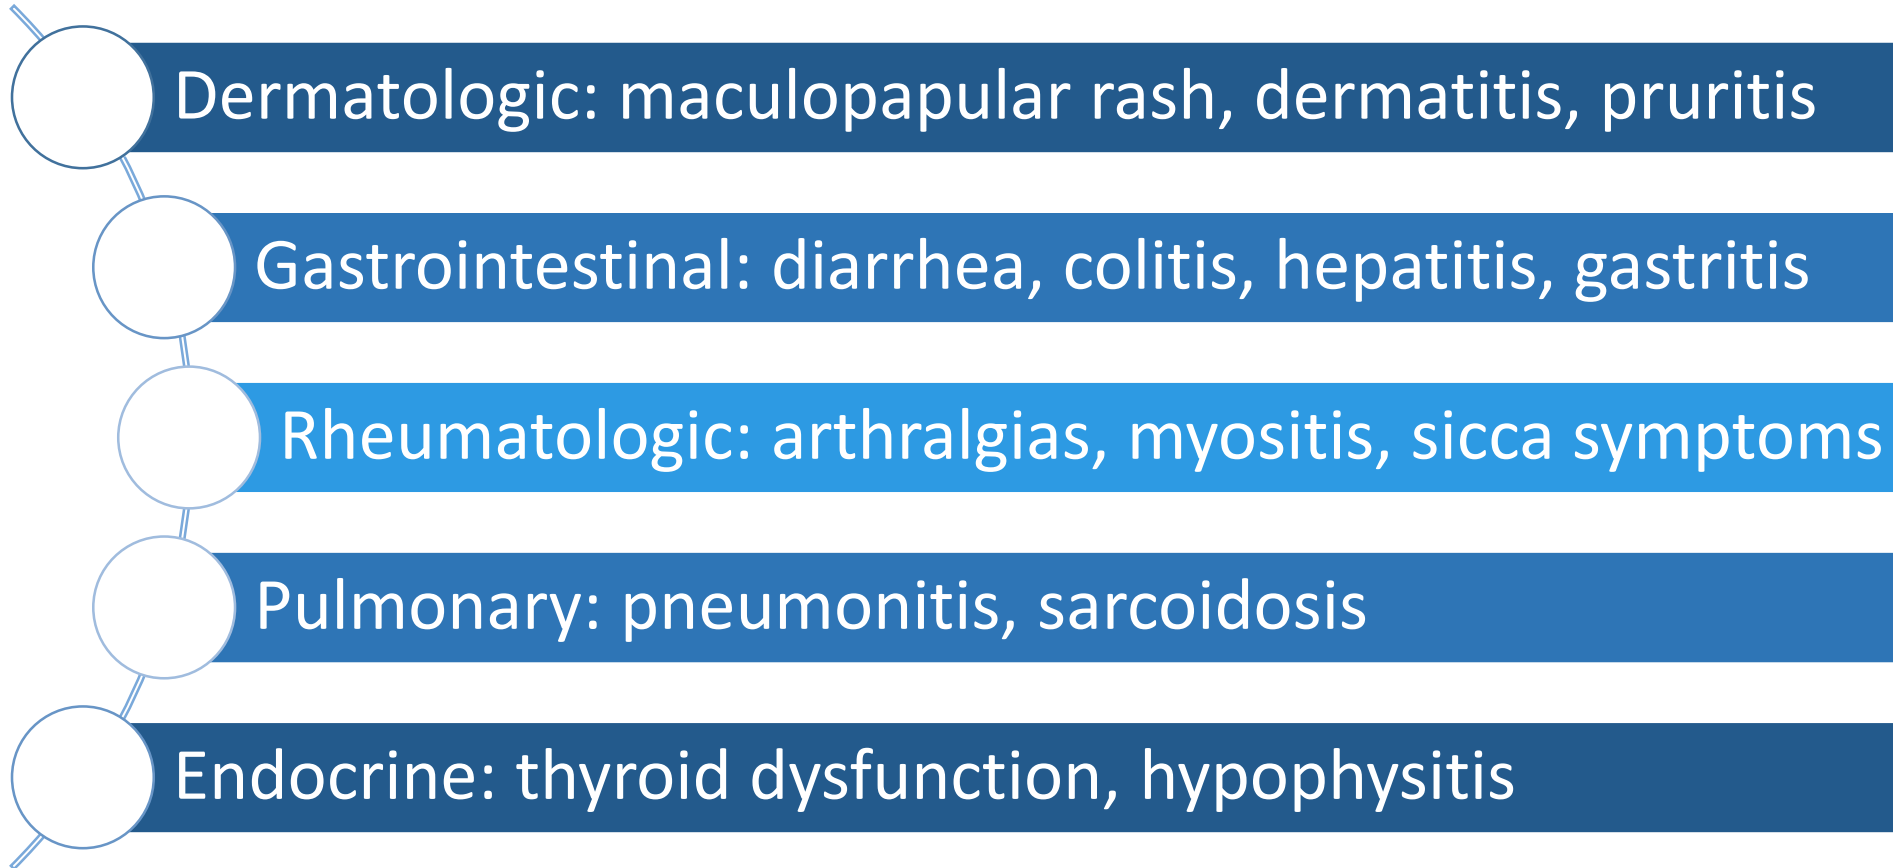

### No. at risk

Ipilimumab	15	2	0	0	0	0	0
Anti-PD-1	34	11	5	2	2	2	0
Combination	6	0	0	0	0	0	0

# Common irAEs with ICIs

# Uncommon irAEs with ICI

## Cardiovascular:

Myocarditis, pericarditis,  
arrhythmias

## Renal:

Interstitial nephritis,  
granulomatous nephritis

## Endocrine:

Adrenal insufficiency,  
pancreatitis, type 1  
diabetes mellitus

## Hematologic:

Hemolytic anemia, red  
cell aplasia, neutropenia,  
thrombocytopenia

## Neurologic:

Myasthenia gravis,  
Guillain-Barré syndrome,  
peripheral neuropathies

## Ophthalmologic:

Uveitis, episcleritis,  
conjunctivitis

# Pre-treatment screening

- Patient History
  - Autoimmune, infectious, endocrine, organ-specific diseases
  - Baseline bowel habits
- Dermatologic
  - Full skin and mucosal exam
- Pulmonary
  - Baseline O<sub>2</sub> saturation
- Cardiovascular
  - ECG
  - Troponin I or T
- Blood tests
  - CBC with diff
  - CMP
  - TSH and free T4
  - HbA1c
  - Total CK
  - Fasting lipid profile
  - Infectious disease screen:
    - Hepatitis serologies
    - CMV antibody
    - HIV antibody and antigen (p24)
    - TB testing (T-spot, quantiferon gold)

# Additional screening for high-risk patients

- Endocrine tests
  - 8 am cortisol and ACTH
- Cardiac tests
  - Brain natriuretic peptide (BNP) or N-terminal pro B-type natriuretic peptide (NT pro-BNP)
- Pulmonary tests
  - PFTs
  - 6MWT

# Approach to Treatment

- Treatment approach is guided by grading of specific toxicity
- Resources for grading:
  - SITC Toxicity Management Working Group
  - Common Terminology Criteria for Adverse Events
  - National Comprehensive Cancer Network
- 1<sup>st</sup> line for **MOST** irAE's is systemic high-dose corticosteroids
  - Endocrine toxicities managed with hormone replacement
  - Some grade 1-2 irAEs may respond to topical steroids (dermatologic, ophthalmologic)
- OTC drugs may not be appropriate for managing symptoms
  - i.e. loperamide for colitis may result in bowel perforation

# General corticosteroid management

Grade of irAE	Corticosteroid Management	Additional Notes
1	Usually not indicated	Continue immunotherapy
2	<ul style="list-style-type: none"> <li>Start <b>prednisone 0.5-1 mg/kg/day</b> (or equivalent dose of IV methylprednisolone)</li> <li>If no improvement in 2-3 days, <b>increase dose</b> to 2 mg/kg/day</li> <li>Once improved to ≤grade 1, start <b>4-6 week steroid taper</b></li> </ul>	<ul style="list-style-type: none"> <li><b>Hold immunotherapy</b> during corticosteroid use</li> <li><b>Continue immunotherapy</b> once resolved to ≤grade 1 and off corticosteroids</li> <li>Start proton pump inhibitor for GI prophylaxis</li> </ul>

# General corticosteroid management

Grade of irAE	Corticosteroid Management	Additional Notes
3	<ul style="list-style-type: none"> <li>Start <b>prednisone 1-2 mg/kg/day</b> (or equivalent dose of IV methylprednisolone)</li> <li>If no improvement in 2–3 days, <b>ADD additional</b> immunosuppressant</li> <li>Once improved to <math>\leq</math> grade 1, start <b>4–6-week steroid taper</b></li> </ul>	<ul style="list-style-type: none"> <li><b>Hold immunotherapy</b>; if symptoms do not improve in 4–6 weeks, <b>discontinue immunotherapy</b></li> <li>Start proton pump inhibitor for GI prophylaxis</li> <li>Add PJP prophylaxis if more than 3 weeks of immunosuppression expected (<math>&gt;30</math> mg prednisone or equivalent/day)</li> </ul>
4		<ul style="list-style-type: none"> <li><b>Discontinue immunotherapy</b></li> <li>Start proton pump inhibitor for GI prophylaxis</li> <li>Add PJP prophylaxis if more than 3 weeks of immunosuppression expected (<math>&gt;30</math> mg prednisone or equivalent/day)</li> </ul>

# Additional immunosuppressives

- **Infliximab: anti-TNF- $\alpha$  mAb**
  - Hepatotoxic so should NOT be used for immune-mediated hepatitis
  - Risk for hepatitis B and tuberculosis activation; obtain hepatitis serologies and TB testing prior to initiation
  - Dose: 5 mg/kg; 2<sup>nd</sup> dose may be administered after 2 weeks
- **Vedolizumab:  $\alpha 4\beta 7$  integrin mAb**
  - **Selective GI immunosuppression** → inhibits migration of T cells across endothelium into inflamed GI tissues
  - Dose: 300 mg; repeat dose at 2 and 6 weeks
- **Others: mycophenolate, IVIG, tacrolimus**

# Effect of irAEs on patient outcomes

No significant difference in survival in melanoma patients who discontinued ipilimumab + nivolumab due to irAEs versus those who did not discontinue treatment

# Autoimmunity as prognostic marker?

Based on **retrospective** data, patients who experience irAEs (regardless of needing treatment) may have better outcomes compared to patients who do not experience irAEs

# Number of irAEs on patient outcomes

Nivolumab in metastatic melanoma: greater OS  
 in patients with 3+ irAEs versus  $\leq 1$  irAE

Patients receiving ICI's for various malignancies:  
 greater OS in those with 3+ irAEs versus  $\leq 2$  irAEs

# Impact of toxicity management on patient outcomes

While still under debate, the administration of immunosuppressive treatments NOR the type of immunosuppressant used for irAE management does not seem to impact cancer control

# Rechallenging with ICI after irAEs

- Patients should not be rechallenged until irAE resolved to grade  $\leq 1$
- Re-challenge with anti-PD-1/L1 after anti-CTLA-4  $\pm$  anti-PD-1 likely safe
- Caution in re-challenging with same ICI in patients who previously had grade 3-4 irAEs

# Patients with autoimmune disorders

- Ipilimumab in melanoma patients
  - 29% experienced flare of pre-existing disorder; 29% experienced new irAEs
  - 56% experienced no flare OR additional irAEs
- PD-1 in melanoma patients
  - 38% experienced flare; 29% experienced new irAEs
  - Lower response rates in patients who remained on immunosuppressive treatment (15% vs 44%)
- Efficacy appears similar for patients with autoimmune disorders compared to those without

# ICI use in SOT or SCT

- Patients who relapse after allogeneic SCT:
  - Ipilimumab: 32% response (10 mg/kg); 14% GVHD; 21% irAEs
  - Anti-PD-1: 77% response; 26% died due to new-onset GVHD
- Solid organ data is limited; most is in renal SOT patients
  - One retrospective study (n=39) reported graft loss in 81% and death in 46%
  - Also reported rapid time to rejection with median onset of 21 days
- PD-1 pathway appears to be more critical in allograft immune tolerance compared to CTLA-4 pathway

# CAR T-cell related toxicities

More  
Common

Cytokine release syndrome

Immune cell associated neurotoxicity syndrome (ICANS)

Less  
Common

Hemophagocytic Lymphohistiocytosis/  
Macrophage Activation Syndrome (HLH/MAS)

Anaphylaxis, B cell aplasia and  
hypogammaglobulinemia

# CRS and Neurotoxicity

- Should not be viewed as two unrelated adverse events
  - Overlapping toxicities from excessive immune activation
  - May occur together or exclusive of one another
  - However, they do have distinct timing and responses to treatment
- Risk factors for both include:
  - High disease burden
  - Higher infused CAR-T cell dose
  - High intensity lymphodepletion regimen
  - Pre-existing endothelial activation
  - Severe thrombocytopenia

# Cytokine release syndrome

# Cytokine release syndrome

- Occurs in ~70% of patients; severe = 12-47%
  - Median onset 2-3 days after infusion, typical duration 7-8 days
- Multiple grading systems exist (MSKCC, CarTox, ASTCT)
  - Hypotension and hypoxia are main drivers of CRS severity
- Tocilizumab approved for CRS treatment (blocks IL-6R)
  - Dose for patients >30 kg: 8 mg/kg (up to 800 mg/dose)
  - May be repeated every 8 hours up to 4 doses
- Consider adding dexamethasone 10 mg q6h for grade 3-4 CRS and/or refractory to tocilizumab

# Neurotoxicity

- Also called CAR-T Related Encephalopathy Syndrome (CRES) or iIEC-associated neurologic syndrome (ICANS)
- Occurs in 20-64% of patients,  $\geq$  grade 3 in 11-42%
  - Onset 4-5 days after infusion, typical duration 5-12 days
- Common symptoms include encephalopathy, headache, delirium, anxiety, tremor, aphasia
  - Severe neurotoxicity: seizures, cerebral edema, hemi/paraparesis
- Diagnosis usually based on clinical symptoms
  - MRI/CT often negative although ~30% will have abnormal MRI (poorer outcome)
- Also has multiple grading systems which guide treatment
  - Usually includes early use of high-dose steroids (dexamethasone 10 mg IV q6h)

# HLH/MAS

- Inflammatory syndrome caused by hyperactivation of macrophages and lymphocytes
- Rare; frequency reported to be as low as ~1%
- Should be managed with anti-IL-6 and corticosteroid therapy
- If no improvement after 48 hours, consider adding etoposide for additional immunosuppression
  - Dose: 75-100 mg/m<sup>2</sup>
  - May be repeated after 4-7 days

## Box 5 | Diagnostic criteria for CAR-T-cell-related HLH/MAS

A patient might have HLH/MAS if he/she had a peak serum ferritin level of >10,000 ng/ml during the cytokine-release syndrome phase of CAR-T-cell therapy (typically the first 5 days after cell infusion) and subsequently developed any two of the following:

- Grade ≥3 increase in serum bilirubin, aspartate aminotransferase, or alanine aminotransferase levels\*
- Grade ≥3 oliguria or increase in serum creatinine levels\*
- Grade ≥3 pulmonary oedema\*
- Presence of haemophagocytosis in bone marrow or organs based on histopathological assessment of cell morphology and/or CD68 immunohistochemistry

# The importance of patient education

- Many immune-related adverse events can present in similar ways to other disease states, but the treatment of them is very different.
- Patients may not go back to their oncologist for treatment of irAEs and need to identify themselves as immunotherapy recipients
  - Emergency room & general practitioners need to understand the proper identification and management of irAEs
- Reassure patients that irAEs will likely resolve over time (except endocrinopathies)

# Education along the healthcare continuum

- Patients may not go back to their original clinic for adverse event management
- Emergency departments and primary care physicians need to recognize and know how to manage irAEs
- For example, the most common irAE in emergency departments is diarrhea – recognize immune-related symptoms versus other causes

**Management of Immunotherapy-Related Toxicities**

# Case #1

- 54 yo M former smoker who presented initially with hoarseness
- ENT ENT eval noted cord paralysis; imaging showed a mediastinal mass and adrenal metastasis. EBUS confirmed adenocarcinoma, CK7(+), TTF1 (+), CK20 (-)
- s/p gemcitabine, paclitaxel, and bevacizumab with maintenance bevacizumab 2/09-9/09
- s/p pemetrexed, carboplatin 9/2009 -12/09
- Right adrenalectomy Jan 01 2010. RFA of the liver in Nov 2011
- Erlotinib “Veristat good” 2/2014-3/2015.
- PET showed retrocrural, peripancreatic, aortocaval, and left periaortic lymph node chains, as well as worsening left adrenal metastases, left adrenal metastasis and left supraclavicular lymph node.
- He was enrolled on a clinical trial to receive Nivolumab/Ipilimumab 4/2015

## Case Study #1 (con't)

- Received 2 cycles of Nivolumab + Ipilimumab without issues.
- C3D1: Missed appt for disease evaluation due to complaints of diarrhea, arthritis, and conjunctivitis.
- He reports 6 liquid stools a day, and usually has constipation.

What would you do next?

1. Prescribe PO Loperamide and Naproxen
2. Prescribe PO Prednisone
3. Prescribe IV Prednisone 1 mg/kg and PO Naproxen
4. Prescribe IV Prednisone 1 mg/kg and steroid eye drops

## Case #1 (con't)

- Disease evaluation showed a CR; we decided to give one addition dose of Nivolumab
- Presented prior to planned C4D1 visit with new SOB, cough and feeling unwell
- PE showed hypoxia (60% on room air)

# Case Study 1

What would you do next?

1. Perform Bronchoscopy to ensure no evidence of infection
2. Prescribe methylprednisolone 2mg/kg TID and MMF 500 mg BID
3. Prescribe methylprednisolone 2 mg/kg QD and Infliximab 5 mg/kg q2w
4. #1 and #2
5. #1 and #3

# Case Study # 1

## Case Study #2

- 64 year old lady with metastatic acral lentiginous melanoma treated with left heel wide excision
- PET 10/2016 confirmed metastatic disease in L thigh, L axilla and RML. L axillary LN bx (+) BRAF, KIT negative
- 12/2016- 2/2017 Nivolumab + Ipilimumab
- PET 3/2017 reveals new splenic lesion as well as left pelvic metastases with favorable response in the RML, mediastinal and hilar adenopathy.
- 6/2017 enrolled at a trial at Sarah Cannon to receive Pembrolizimab and HDAC inhibitor.
- Tolerated first 3 cycles without difficulties

## Case Study #2

Presented prior to cycle 4 with  
inability to swallow and rash

## Case Study 2

What would you do next?

1. Stop Pembro/HDAC and observe
2. PO Prednisone
3. IV methylprednisolone
4. Dexamethasone rinses

## Case #2 (con't)

- Skin nodules dried up and tongue improved with PO Prednisone 1 mg/kg qd with slow taper over 6 weeks.
- Disease evaluation showed stable disease.

What would you do now?

1. Restart Pembrolizumab
2. Begin watchful waiting
3. Add Ipilimumab

## Case #2 (con't)

- Patient and family were keen to restart given disease stabilization.
- After only 1 more dose of Pembro/HDAC the skin lesions and tongue lesions recurred.
- This time they were refractory to Prednisone but responsive to Methylprednisolone.
- Steroid taper required months, during which time her disease began to progress.
