

# **Viral Biomarker Discovery using CyTOF**

Holden T. Maecker, PhD  
Stanford University

**STANFORD**  
SCHOOL OF MEDICINE

Institute for Immunity,  
Transplantation and Infection

# What makes a protective cellular response?

- Cytotoxic CD8+ T cells
- Multifunctional T cells (e.g., IL-2, TNF, IFN $\gamma$ , MIP-1 $\beta$ , CD107)
- Central memory or effector memory T cells
- Lack of exhaustion markers (PD-1, LAG-3, etc.)

# Mass Cytometry (CyTOF) Rationale

Fluorescence cytometry

Mass cytometry

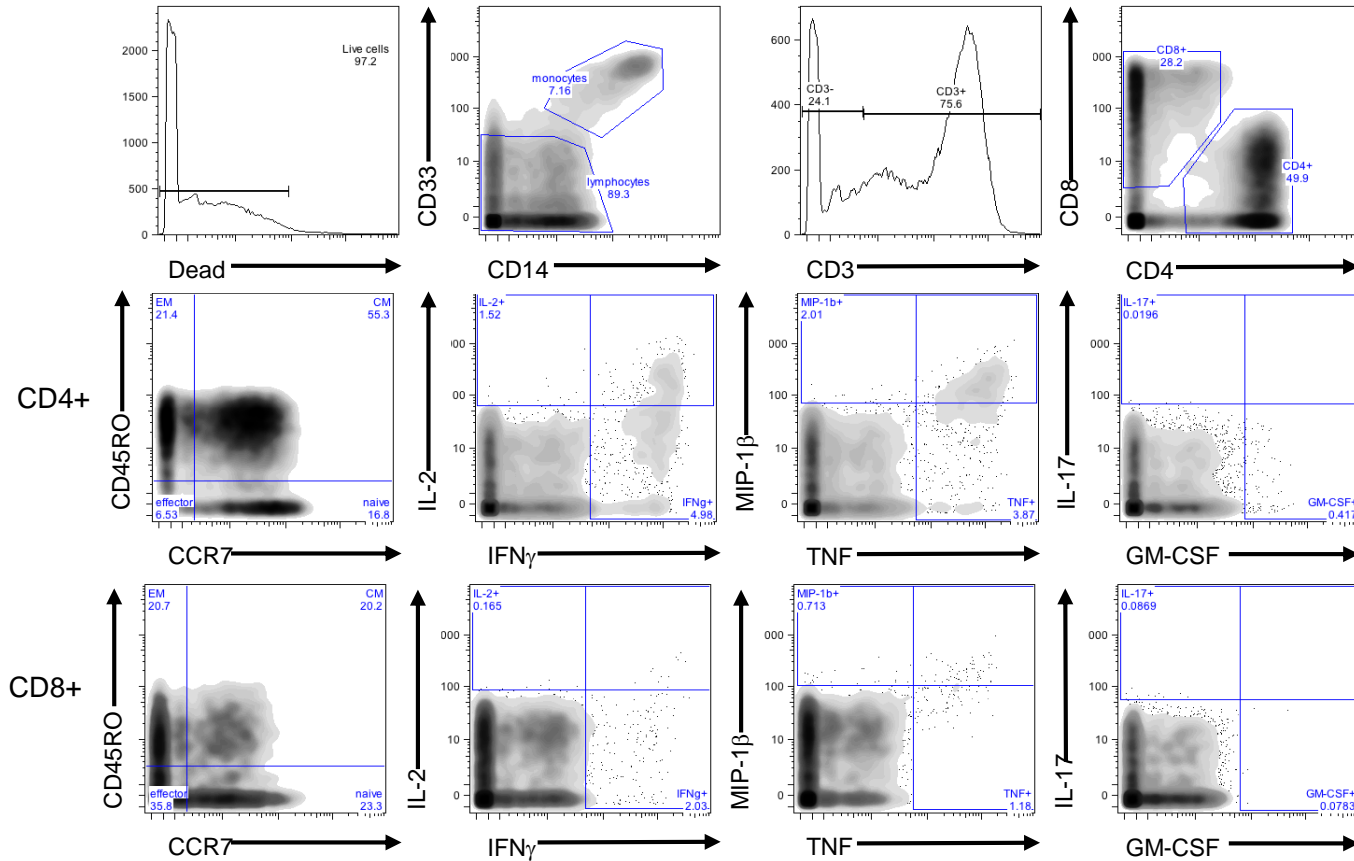

- Many more labels (antibodies)
- Little or no spillover

# Difficult scenarios for CyTOF

- Very rare cell populations
  - Time to acquire
  - Cell loss
- Very large studies
  - Time to acquire
  - Expense

# CyTOF ICS – CMV specific response

# Analytical Approaches

- Manual gating and multivariate modeling of gated populations
- Automated clustering, visualization, and statistical comparison algorithms :
  - SPADE: clustering and 2-D representation of clusters
  - viSNE: dimension reduction and 2-D display of individual cells
  - Citrus: clustering and statistical comparison of groups by cluster

# CMV in lung transplantation

(Sheena Gupta, Sharon Chen, David Lewis, Tyson Holmes)

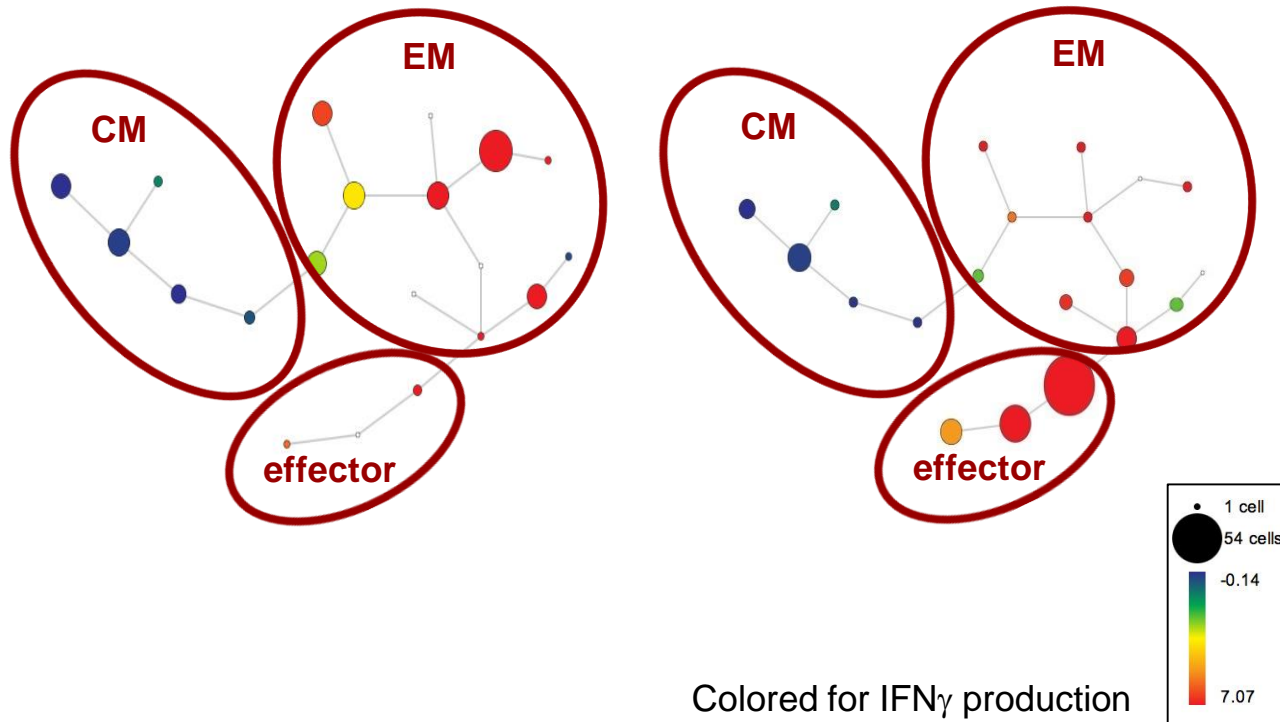

- Can the profile of CMV-specific T cells pre-transplant predict who is at risk of viremia/rejection post-transplant?
  - only for CMV+ recipients
  - may be a long shot
- 24 lung transplant patients with PBMC samples pre-transplant and median clinical follow up for 1.4 years post-transplant
- 18 healthy elderly controls from Jorg Goronzy HIPC cohort

# Identification of antigen-specific T cells

- Separately for CD4+ and CD8+ T cells:
  - Gate on positive cells for each individual cytokine
  - Create a Boolean “or” gate for all cytokines
  - Export new FCS file of only cytokine-positive cells (positive for one or more cytokines)

# SPADE clustering of CMV-specific T cells

# Denoised Ragged Pruning (Tyson Holmes)

- Denoising via Eigendecomposition to de-emphasize parameters with minimal structure
- Hierarchical clustering using principal components
- Ragged pruning to obtain an optimal cluster solution

# CMV-specific peptide pool stimulations

- Immediate early antigen pool:

- IE-1
- IE-2
- US-3
- UL-36

- Late antigen pool:

- Pp65
- UL-32
- UL-48AB
- UL-55 (gB)

# CMV-specific CD4+ T cell clusters

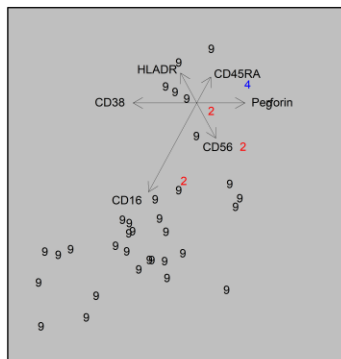

# CMV-specific CD8+ T cell clusters

# Healthy vs. transplant CMV response: CD4

Healthy Unstimulated

Healthy Early Stimulation

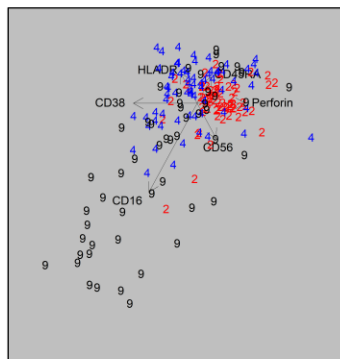

Healthy Late Stimulation

Transplant Unstimulated

Transplant Early Stimulation

Transplant Late Stimulation

# Healthy vs. transplant CMV response: CD8

Healthy Unstimulated

Healthy Early Stimulation

Transplant Early Stimulation

Transplant Late Stimulation

# Cumulative risk of rejection for significant clusters

# Predicting RSV vaccine response

- MedImmune trial of experimental RSV vaccine in elderly
- 5 non-responders,  
14 responders by ELISPOT
- PCA of all cells  
after RSV stimulation
- Frequency of RSV-specific cells

# PCA of responders and non-responders

**A** Day 0, baseline after RSV stim

**B** Day 0, baseline after RSV stim

# Responders have lower baseline IFN $\gamma$ +CD8+ T cells

# Conclusions

- CyTOF ICS assays can be used to monitor detailed phenotypes and functions of antigen-specific T cells
- The quality of a patient's T cell response to CMV prior to organ transplant may predict rejection post-transplant
  - CD57+ CD4 and CD8 T cells
- Response to an RSV vaccine may be associated with baseline immune parameters
  - Activated T cells, anti-RSV CD8 T cells as *negative* predictors
