# Immunotherapy of Hematologic Malignancies

Zihai Li, MD, PhD @Zihai 

Medical University of South Carolina

Society for Immunotherapy of Cancer

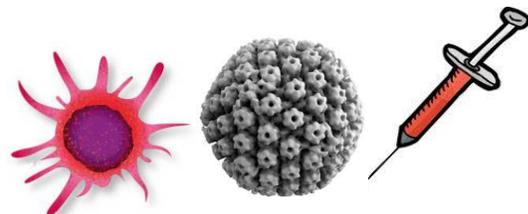

# Disclosures

- No relevant financial relationships to disclose

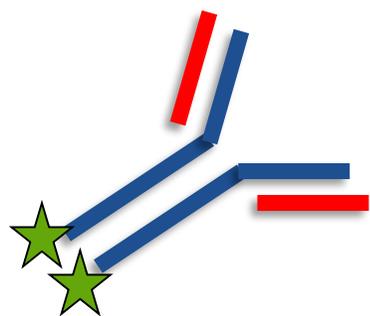

# What is hot in immunotherapy?

**CAR-T**

**Vaccine**

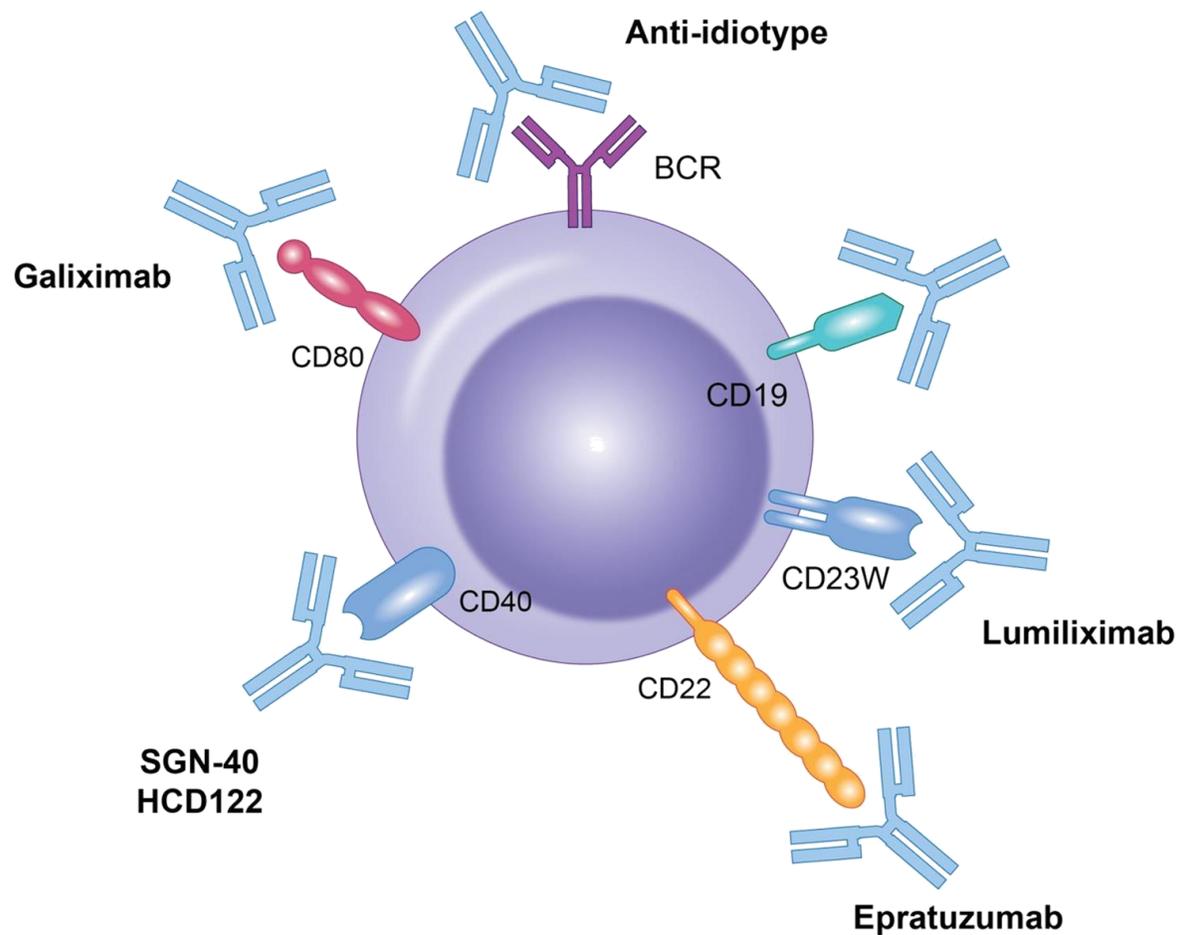

**Magic Bullet**

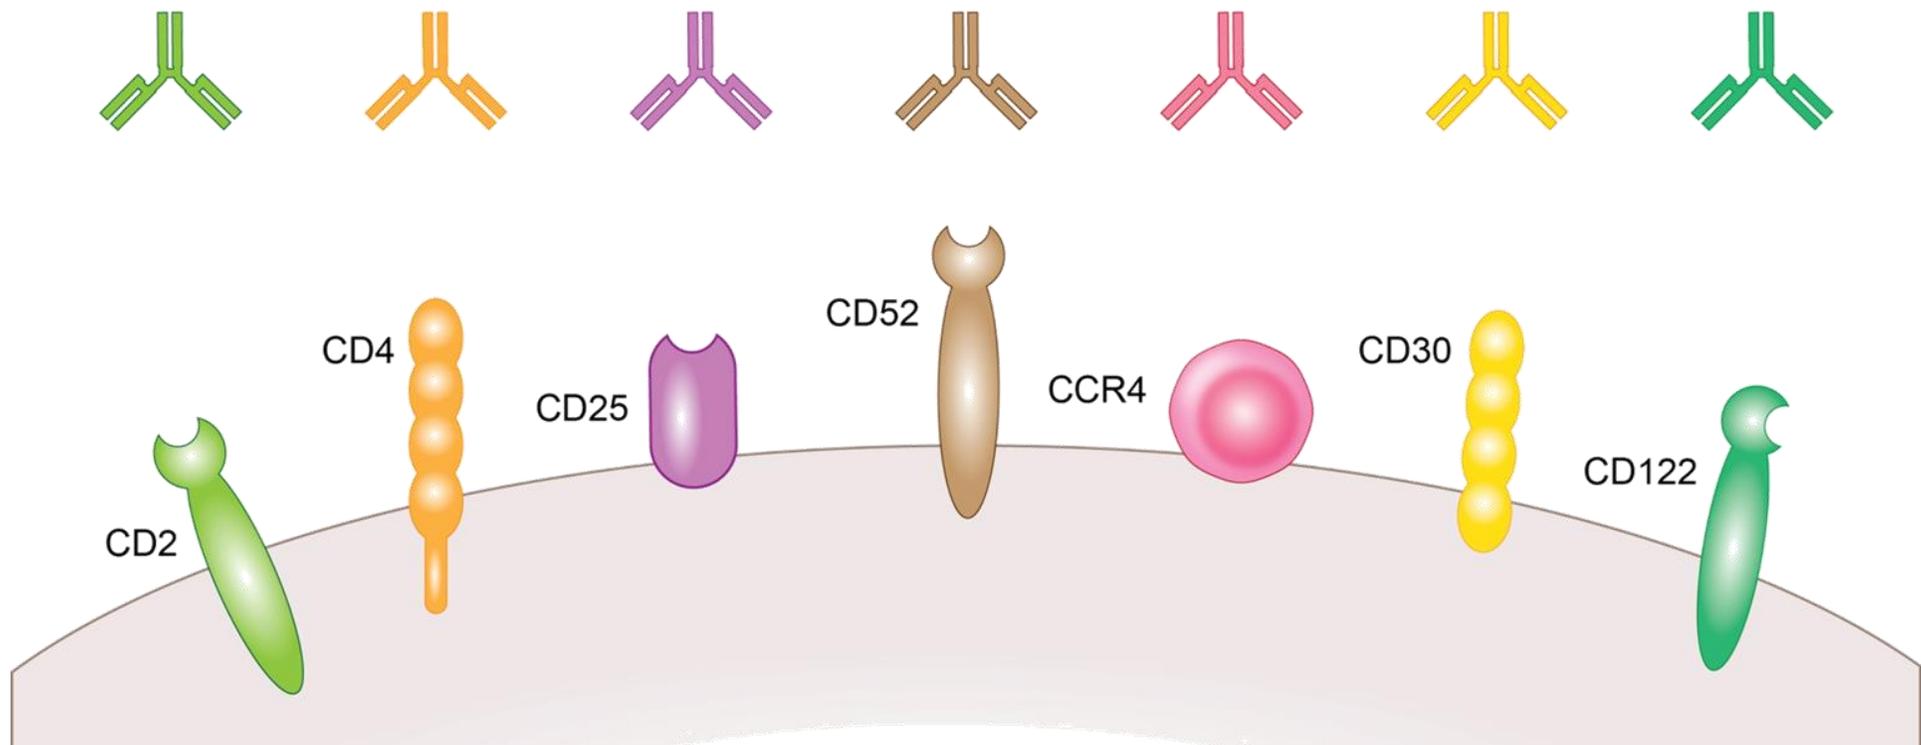

**Checkpoint blockade**

# Monoclonal antibodies targeting B cell lymphomas

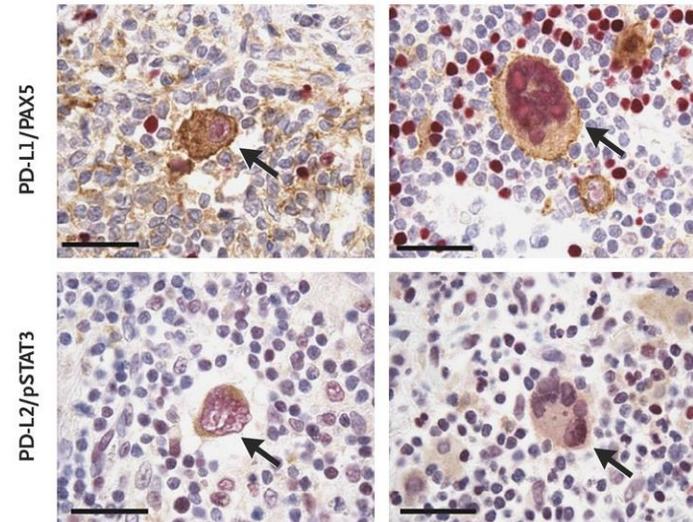

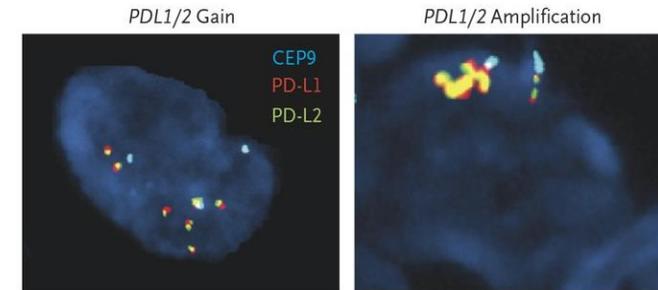

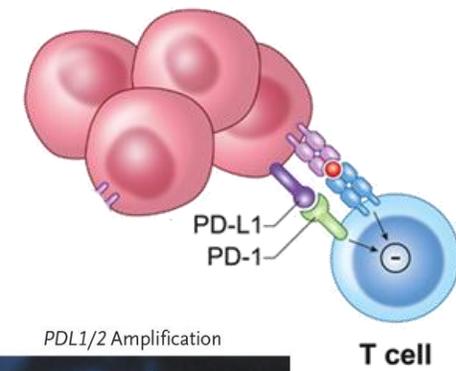

# Monoclonal antibodies targeting T cell lymphomas

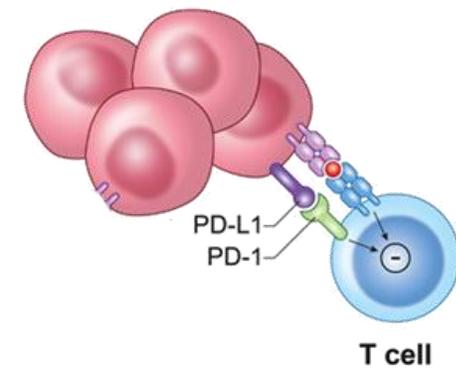

## Checkpoint inhibitors

- Reed-Sternberg cells express both PD-L1 and PD-L2
- Expression of ligands increases with advanced disease
- Unclear whether PD-L1/L2 expression correlates with response to treatment

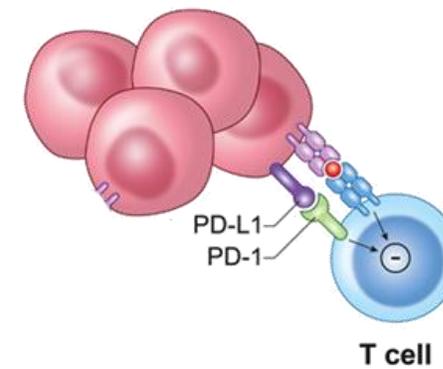

Ansell SM et al. N Engl J Med 2015;372:311-319

## FDA-approved checkpoint inhibitors for hematologic malignancies

- Nivolumab (anti-PD-1)
  - CheckMate – 205/039: Patients with cHL that has relapsed or progressed after autologous hematopoietic stem cell transplantation and posttransplantation brentuximab vedotin (anti-CD30 Ab linked to Monomethyl auristatin E)
  - Accelerated approval – May 17<sup>th</sup>, 2016
- Pembrolizumab (anti-PD-1)
  - KEYNOTE – 087: Adult and pediatric patients with refractory cHL, or patients whose disease has relapsed after three or more lines of therapy
  - Accelerated approval – March 14<sup>th</sup>, 2017

## Nivolumab in Hodgkin lymphoma

**Table 3. Clinical Activity in Nivolumab-Treated Patients.\***

| Variable  | All Patients<br>(N=23) | Failure of Both Stem-Cell<br>Transplantation and Brentuximab<br>(N=15) | No Stem-Cell Transplantation<br>and Failure of Brentuximab<br>(N=3) | No Brentuximab<br>Treatment<br>(N=5)† |
|---|------------------------|--|---|---------------------------------------|
| Best overall response — no. (%)                     |                        |  |   |                                       |
| Complete response                                   | 4 (17)                 | 1 (7)  | 0   | 3 (60)                                |

| Progression-free survival at 24 wk<br>— % (95% CI)‡ | 86 (62–95)             | 85 (52–96)   | NC§   | 80 (20–97)                            |
| Overall survival — wk                               |                        |  |   |                                       |
| Median  | NR                     | NR   | NR  | NR                                    |
| Range at data cutoff¶                               | 21–75                  | 21–75  | 32–55   | 30–50                                 |

\* NC denotes not calculated, and NR not reached.

† In this group, two patients had undergone autologous stem-cell transplantation and three had not.

‡ Point estimates were derived from Kaplan–Meier analyses; 95% confidence intervals were derived from Greenwood's formula.

§ The estimate was not calculated when the percentage of data censoring was above 25%.

¶ Responses were ongoing in 11 patients.

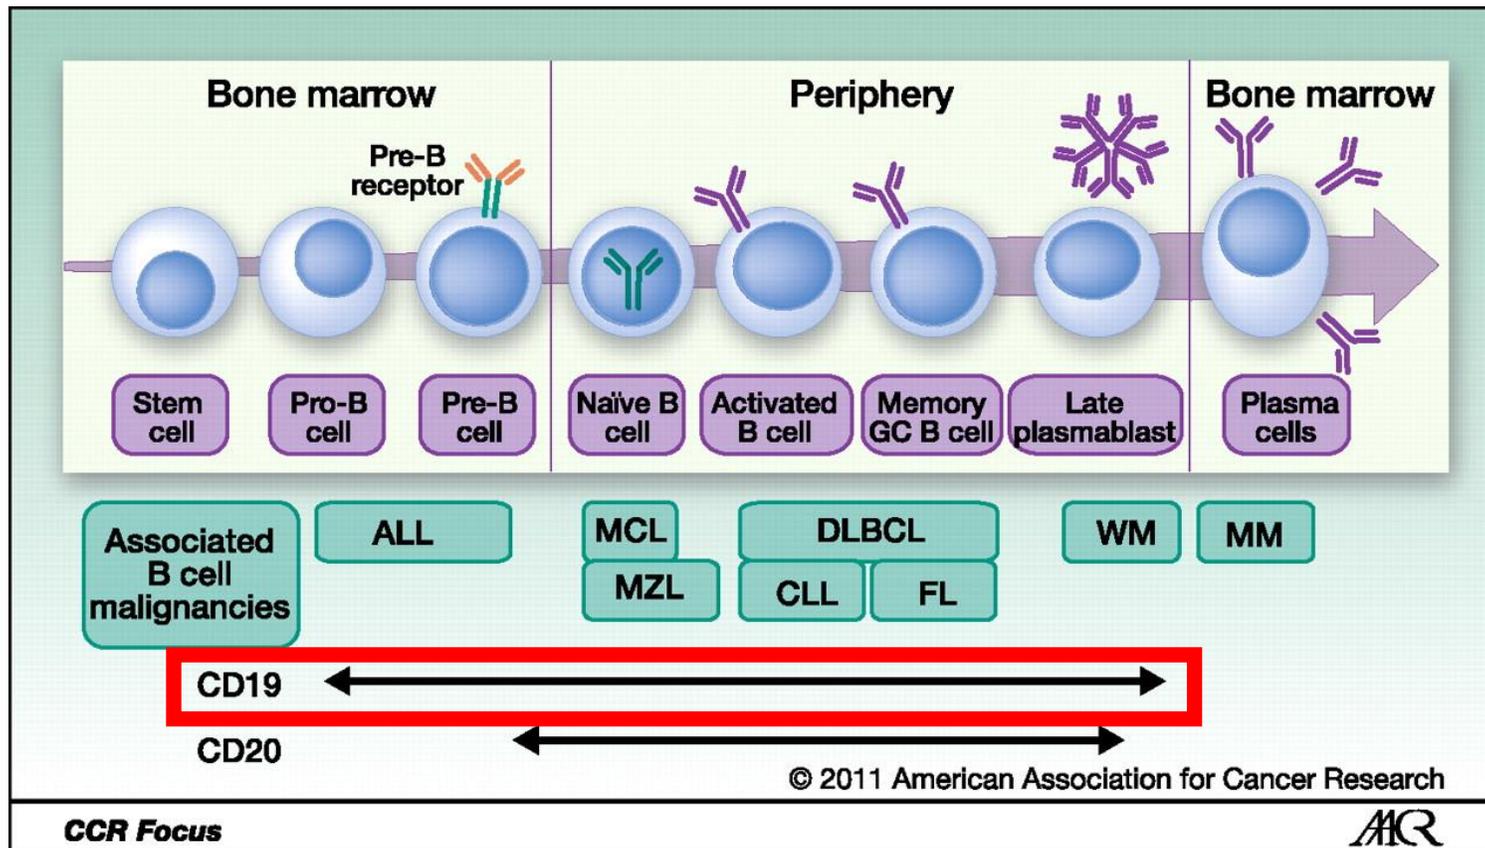

## Patient selection criteria for checkpoint inhibitor therapies

- Expression of the ligand for checkpoint inhibition
  - e.g. PD-L1 expression for anti-PD-1 therapy
- Relapse or progression after previous therapies
  - Nivolumab: After prior HSCT and brentuximab therapy
  - Pembrolizumab: Relapse after three prior treatments
- Presence of co-morbidities:
  - e.g. Presence of active autoimmune diseases which could be worsened

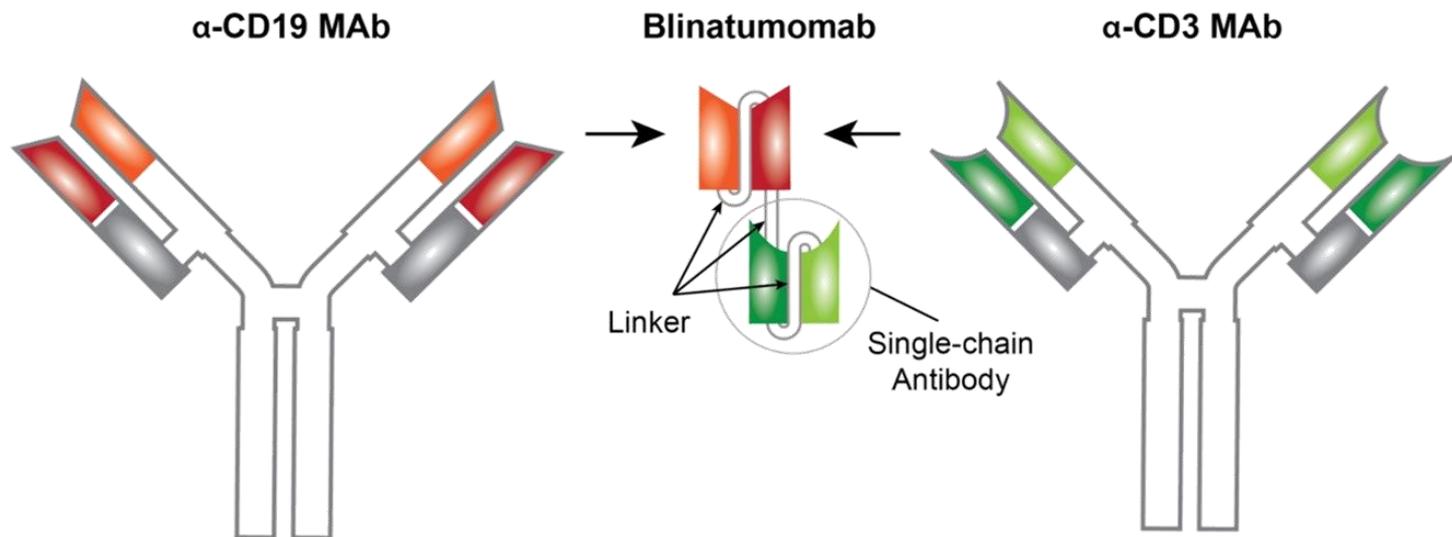

# B cell malignancies are CD19+

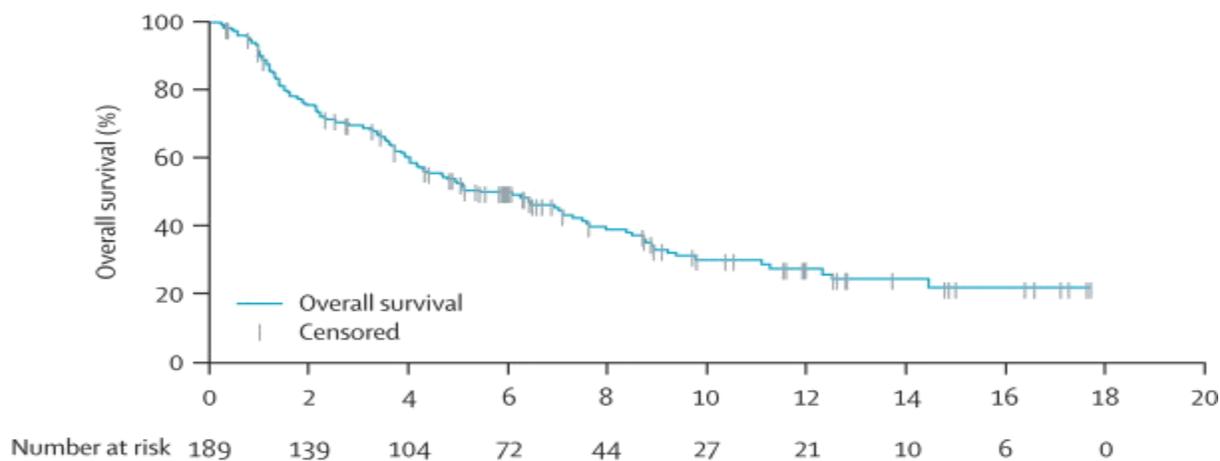

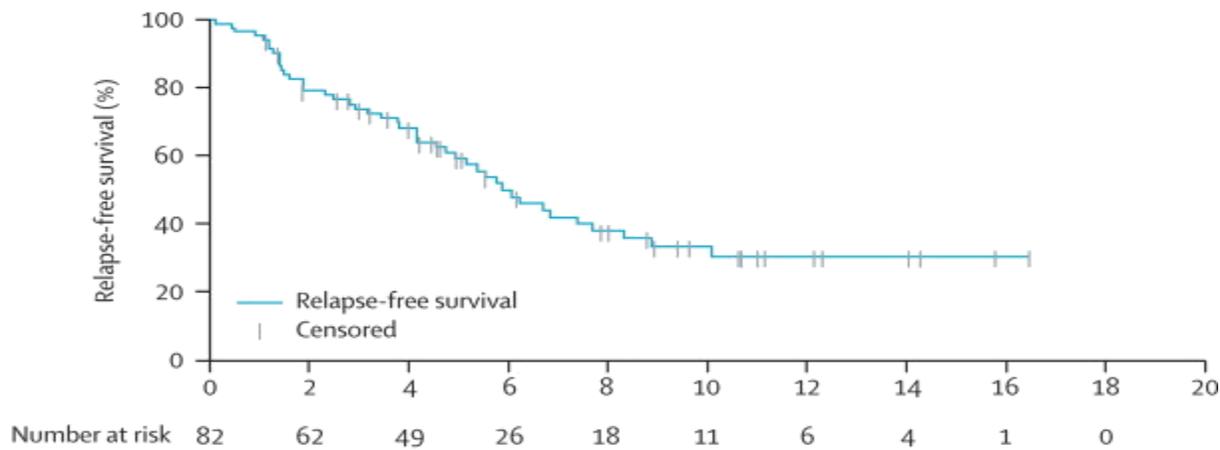

Blanc, V et al., Clinical Cancer Research, Volume 17 , Issue 20

# BiTE (blinatumumab) therapy

- Combines anti-CD19 F(ab) with anti-CD3 F(ab)
- Lacks the Fc region
- TOWER: Patients with relapsed/refractory B-cell precursor ALL
  - Regular approval: July 11<sup>th</sup>, 2017

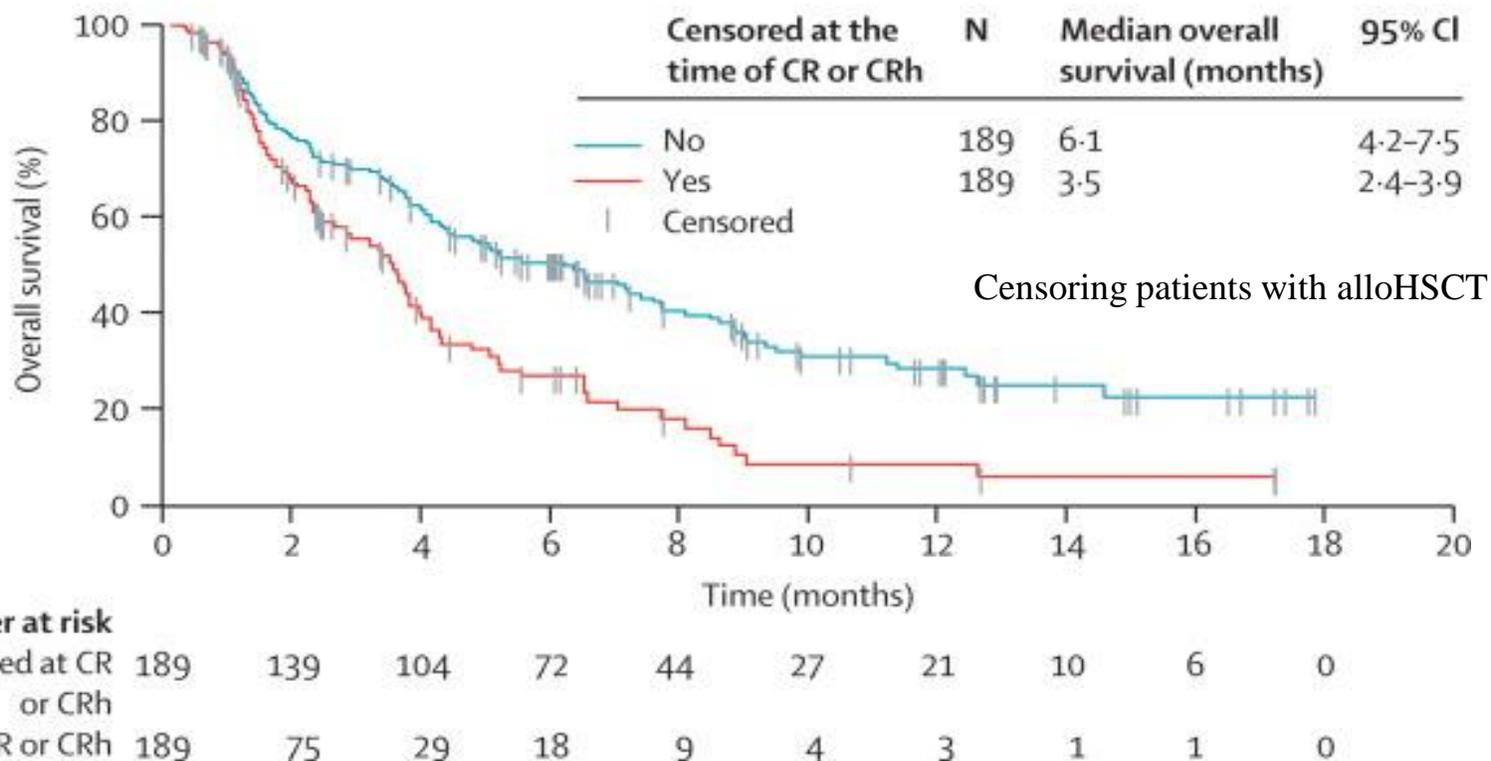

# BiTE therapy in ALL

Topp, Max S et al., The Lancet Oncology , Volume 16 , Issue 1 , 57 - 66

# BiTE therapy in ALL

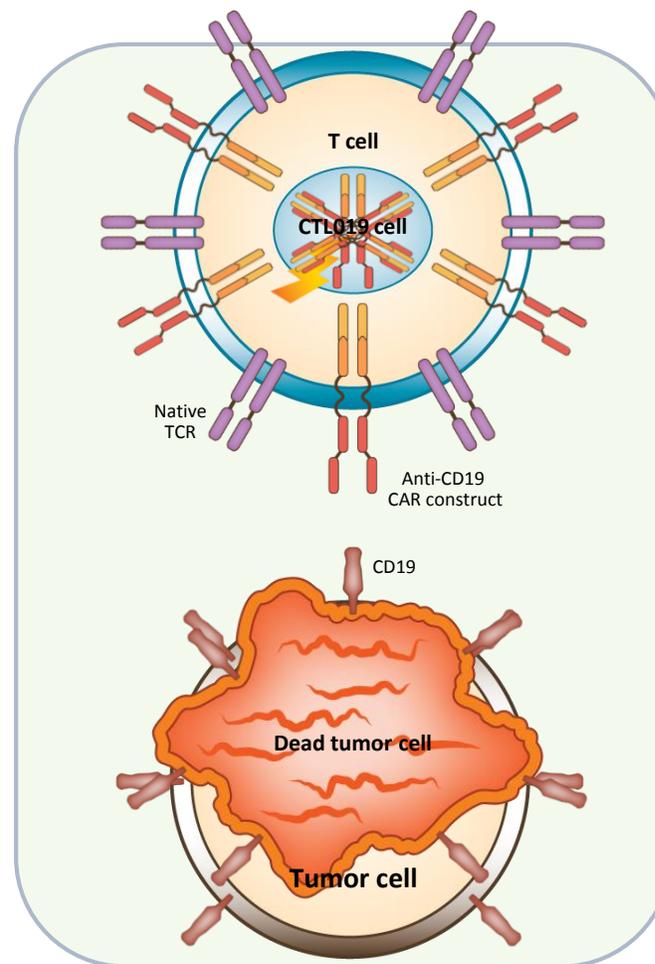

Topp, Max S et al., The Lancet Oncology , Volume 16 , Issue 1 , 57 - 66

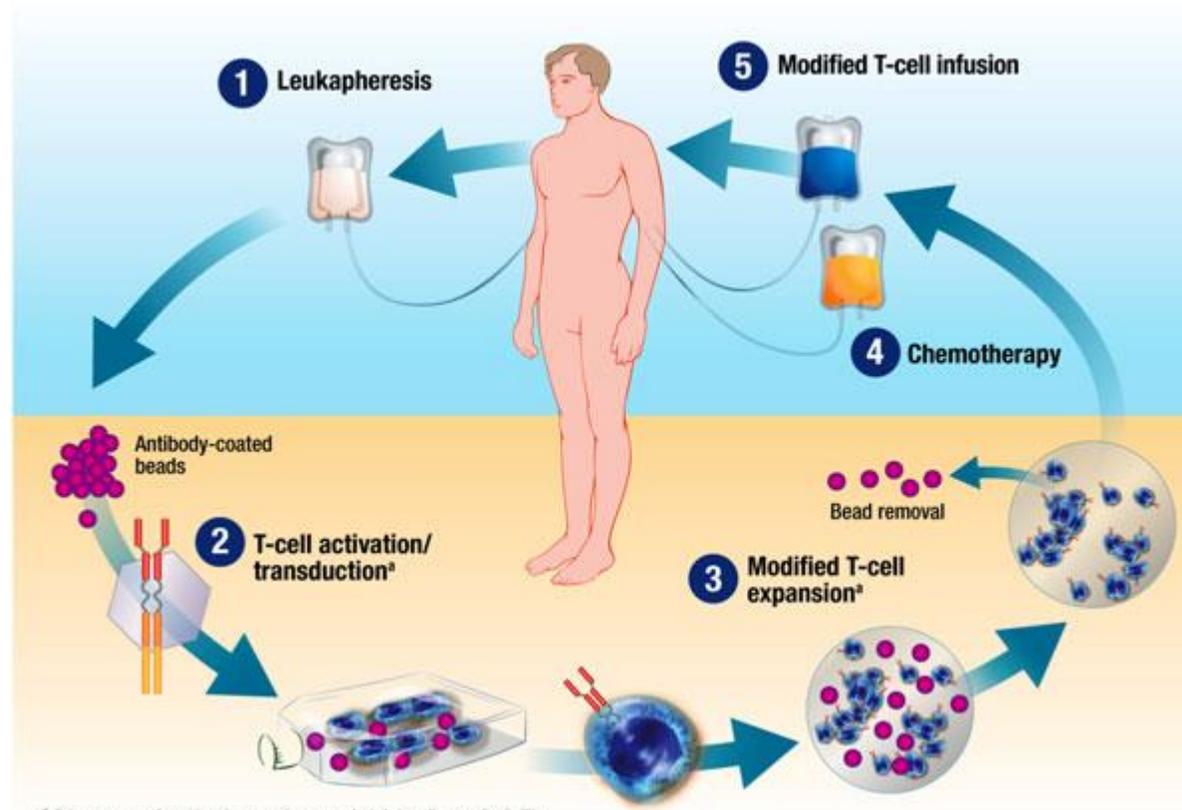

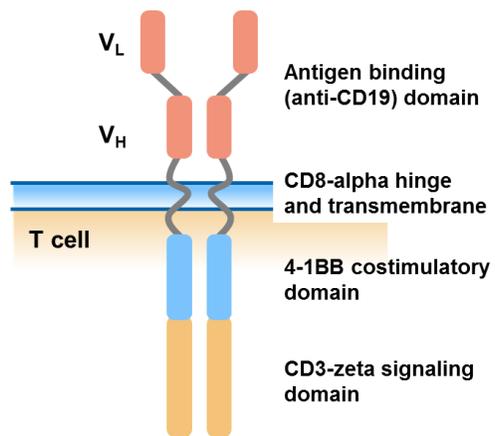

# Chimeric Antigen Receptor (CAR) T cell therapy

- Gene transfer technology stably expresses CARs on T cells<sup>1,2</sup>
- CAR T cell therapy takes advantage of the cytotoxic potential of T cells, killing tumor cells in an *antigen-dependent* manner<sup>1,3</sup>
- Persistent CAR T cells consist of both effector (cytotoxic) and central memory T cells<sup>3</sup>
- **T cells are *non-cross resistant* to chemotherapy**

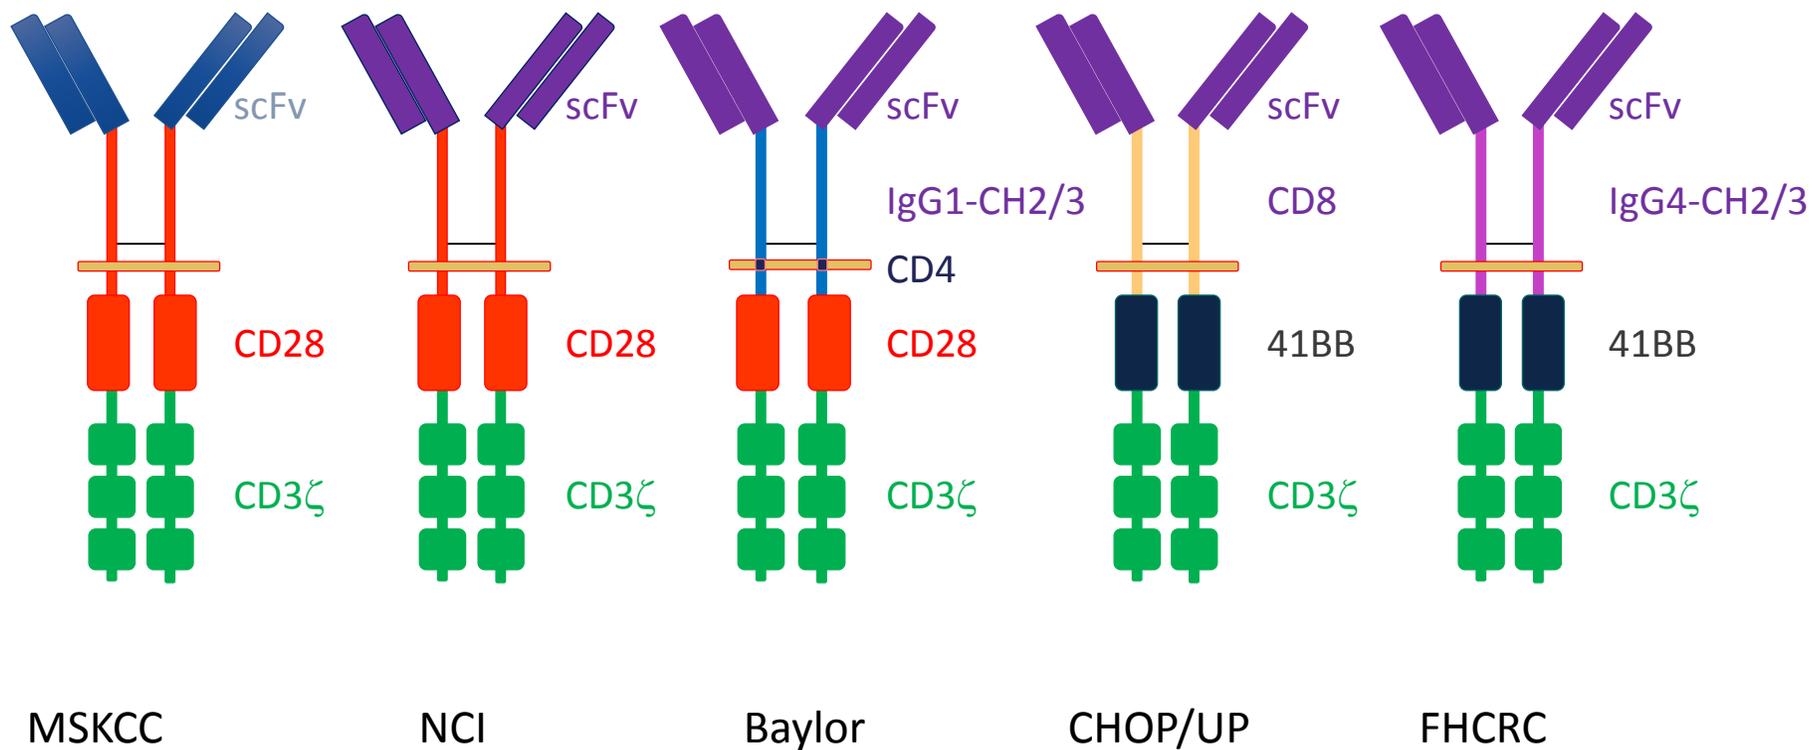

1. Milone MC, et al. *Mol Ther.* 2009;17:1453-1464.
2. Hollyman D, et al. *J Immunother.* 2009;32:169-180.
3. Kalos M, et al. *Sci Transl Med.* 2011;3:95ra73.

# CAR T cell therapy

# Many CAR Flavors

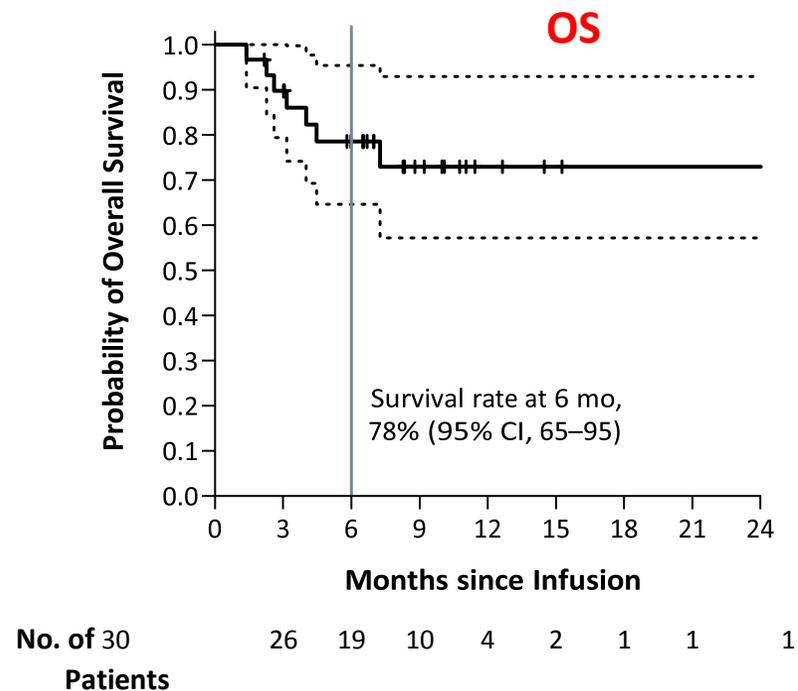

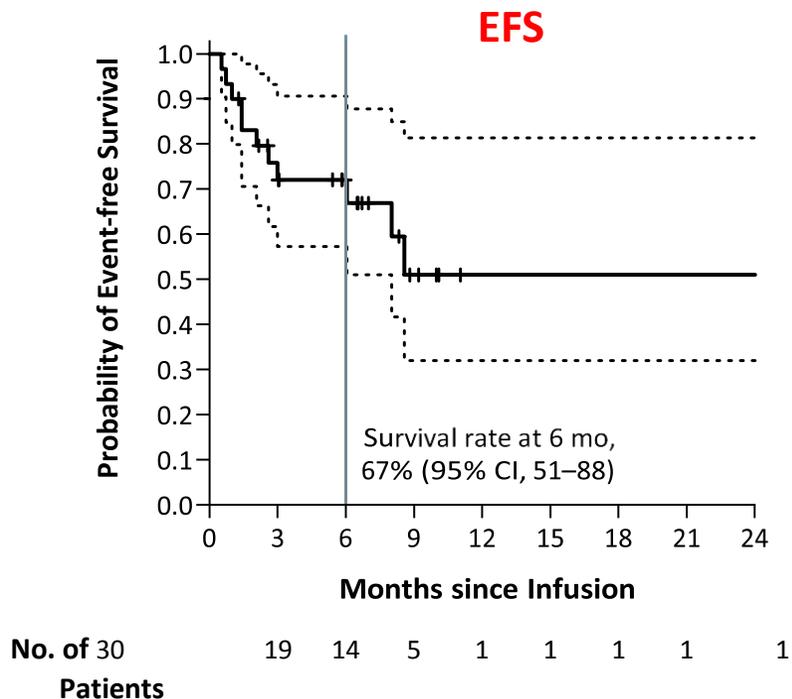

# FDA-approved CAR T cell therapies for hematologic malignancies

- Kymriah (tisagenlecleucel)
  - Patients up to 25 years of age with B-cell precursor ALL that is refractory or in second or later relapse
  - Accelerated approval – August 30<sup>th</sup>, 2017
- Yescarta (axicabtagene ciloleucel)
  - ZUMA-1: Adult patients with relapsed or refractory large B-cell lymphoma after two or more lines of systemic therapy, including diffuse large B-cell lymphoma (DLBCL) not otherwise specified, primary mediastinal large B-cell lymphoma, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma
  - Accelerated approval – October 18<sup>th</sup>, 2017

# CAR T cell therapy in ALL

Maude SL et al. N Engl J Med 2014;371:1507-1517.

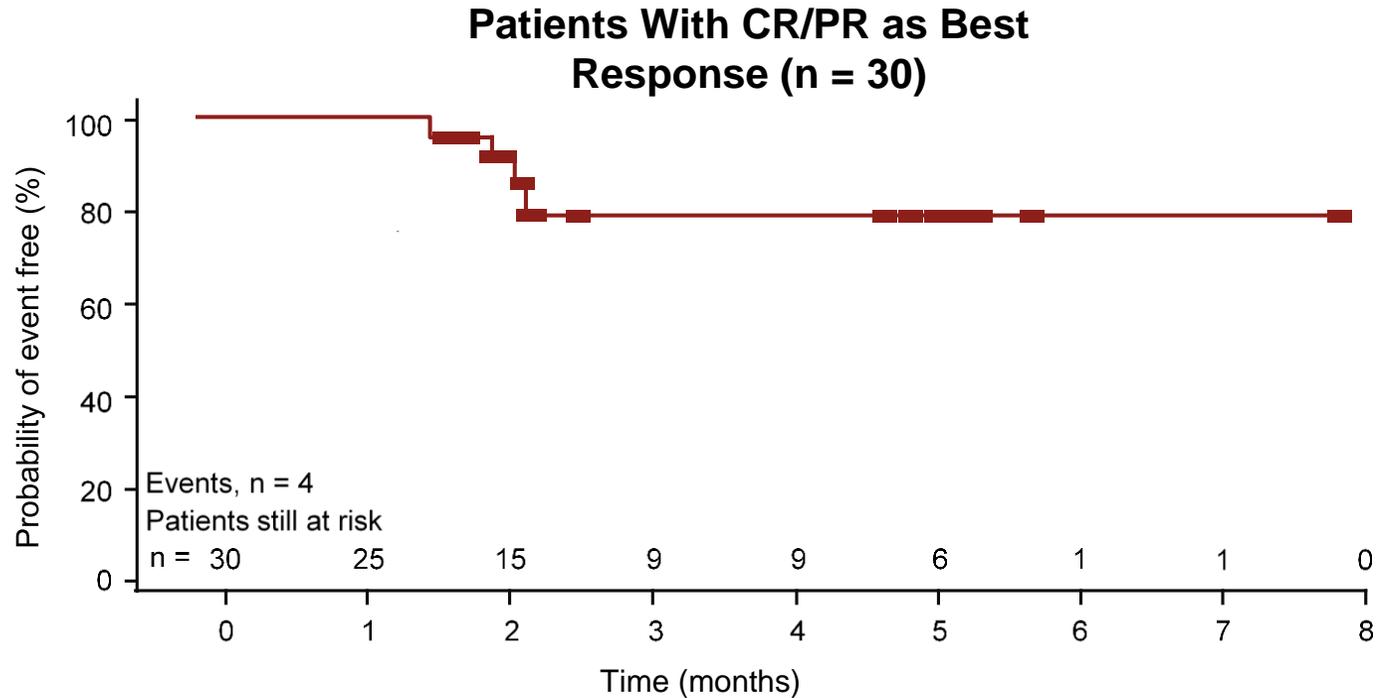

# CAR T cell therapy in DLBCL

*JULIET multi-institutional study*

| Response Rate                                  | Patients<br>(N = 51) <sup>a</sup> |   |
|--|-----------------------------------|---|
| Best overall response (CR + PR)                | 59%                               | P < .0001 <sup>b</sup><br>(95% CI, 44-72) |
| CR <sup>1</sup>                                | 43%                               |   |
| PR <sup>1</sup>                                | 16%                               |   |
| SD <sup>1</sup>                                | 12%                               |   |
| PD <sup>1</sup>                                | 24%                               |   |
| Overall response rate (CR + PR) at<br>3 months | 45%                               |   |
| CR <sup>1</sup>                                | 37%                               |   |

## CAR-T vs T cell engager

| Technology:           | CAR T cells                           | BiTE                            |
|-----------------------|---------------------------------------|---------------------------------|
| Example               | tisagenlecleucel<br>(CAR(CD19) T)     | blinatumumab<br>(anti-CD3/CD19) |
| Dosing                | One infusion                          | Continuous 28 days              |
| Complete Response     | 90%                                   | 66%                             |
| Survival              | 78% 6 mos OS                          | 9 mos median                    |
| Major toxicity        | Cytokine release                      | Cytokine release                |
| Antigen loss relapse? | Yes                                   | Yes                             |
| Challenges            | Complex manufacturing, individualized | Burdensome infusion             |

# Patient selection criteria for CAR T therapies

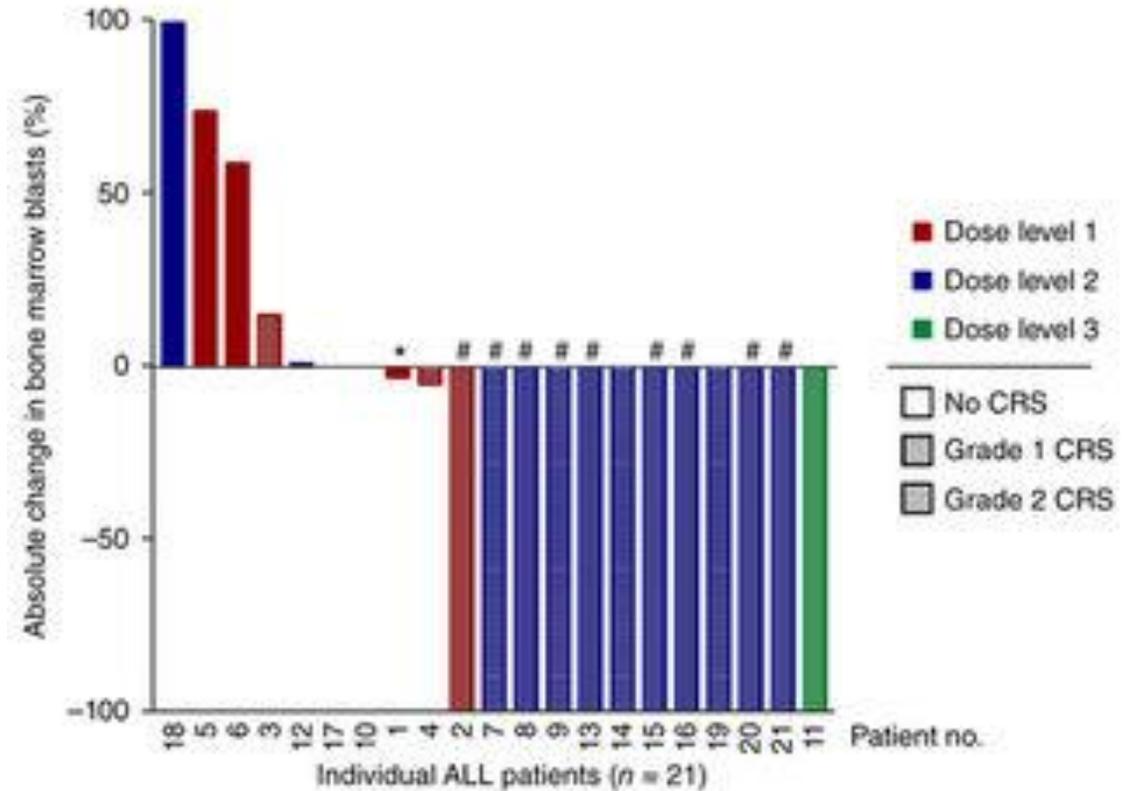

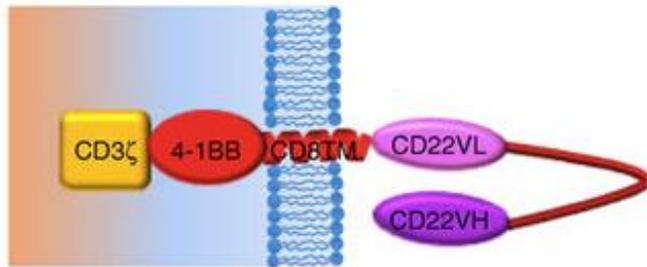

- Expression of the desired antigen for CAR T therapy
  - e.g. CD19 or CD22 expression
- Disease burden
  - CAR T trials: <30% to minimize the risk of cytokine release syndrome
- Presence of co-morbidities
  - e.g. Presence of active autoimmune diseases which could be worsened

## CD19-CAR-T update (2/7/2019)

# Ongoing trials with CAR T therapies for hematologic malignancies

- CD22+ CAR T cells effective in patients with relapsed, CD19- B-ALL

Fry, T.J. et al., Nature Medicine, 2017

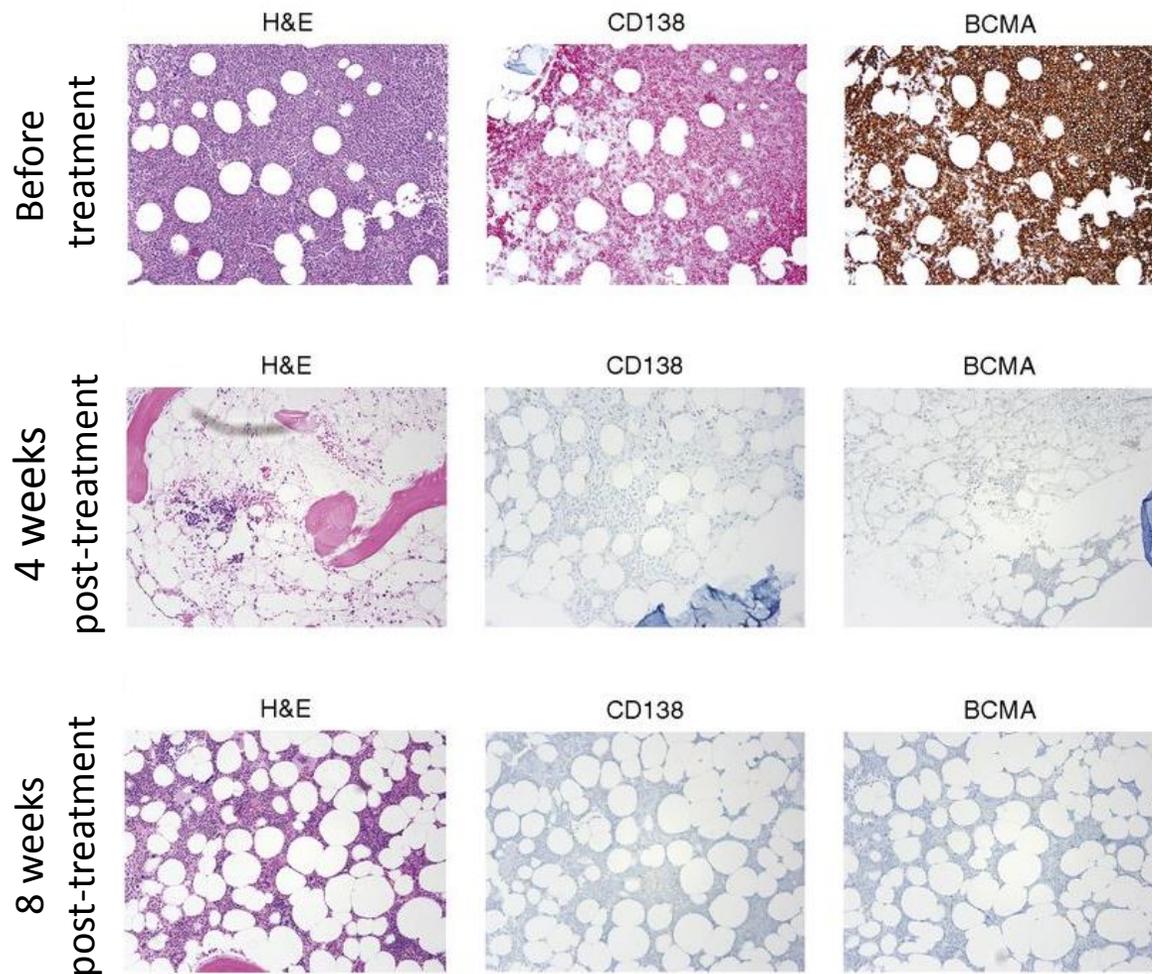

- No approved checkpoint inhibitor therapies
  - KEYNOTE-183/185/023: halted or discontinued due to risk/benefit profile

- Vaccine-based approaches

- Non-Antigen Specific
  - Attenuated measles
  - Whole cell - GM-CSF
  - Dendritic – tumor fusions
- Antigen Specific
  - Idiotypic: RNA, DNA, protein
  - Pulsed dendritic cells
  - Tumor-specific peptides

# On the way: BCMA+ CAR T therapy for myeloma

Syed Abbas Ali et al. Blood 2016;128:1688-1700

- Fan et al. LBA3001  
 ASCO 2017
- 100% ORR
- 33/35 patients in remission within 2 months after BCMA CAR T therapy
- November 17<sup>th</sup>, 2017  
 FDA Breakthrough Designation
