

Nursing Perspective on irAEs: Patient Education, Monitoring and Management

Rebecca Lewis, CRNP

Nurse Practitioner

University of Pittsburgh-HCC Shadyside

Disclosures

- No relevant financial relationships to disclose
- I will not be discussing non-FDA approved indications during my presentation.

Objectives

- Improve the early recognition, education and management of immune-related side effects in cancer immunotherapy patients
- Identify strategies for the management of toxicities
- Determine key points for patient education on the management of side effects

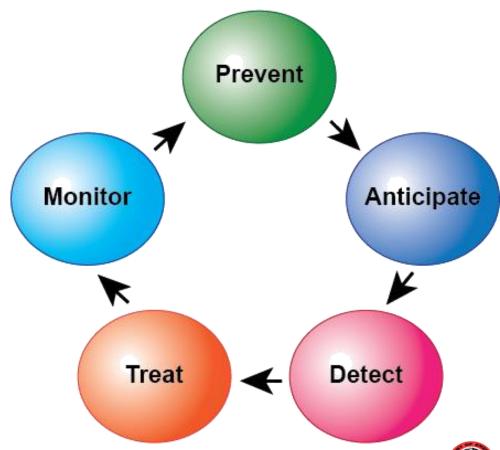

The Five Pillars of Toxicity Management

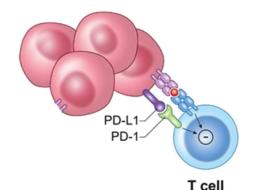

Case Study

- Mr. M.C. is a 65-year-old male with a recent diagnosis of stage IV melanoma to the lungs. Patient has consented to start pembrolizumab (checkpoint inhibitor) at 2mg/kg every 3 wks.
- Mr. M.C and family would like to know what are the most common adverse events with this immunotherapy?

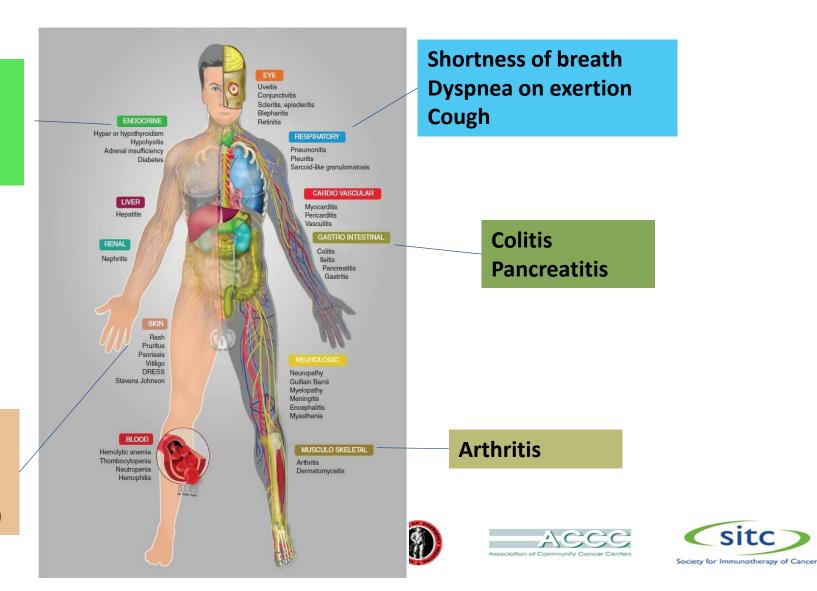

Toxicity Spectrum: Immune Related Adverse Events

Hypothyroid Hypophysitis Adrenal insufficiency Diabetes

Maculopapular rash **Pruritus DRESS** Vitiligo (positive factor)

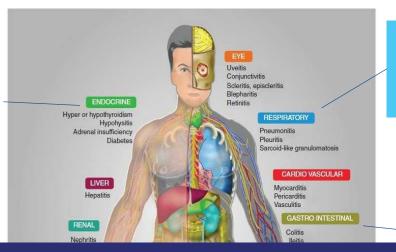

sitc

Toxicity Spectrum: Immune Related Adverse Events

Hypothyroid
Hypophysitis
Adrenal insufficiency
Diabetes

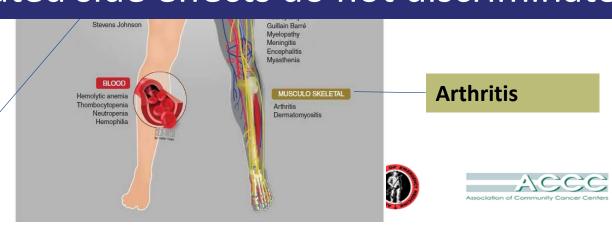

Shortness of breath Dyspnea on exertion Cough

Colitis

These are some of the most common; HOWEVER; immune-related side effects do not discriminate.

Maculopapular rash
Pruritus
DRESS
Vitiligo (positive factor)

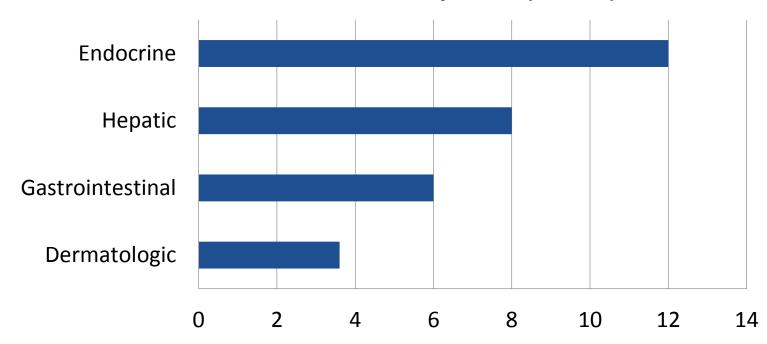

Immune checkpoint inhibitors-irAEs

Median time to development (weeks)

Symptoms to look for with immune check-point inhibitors

Ipilumamab:

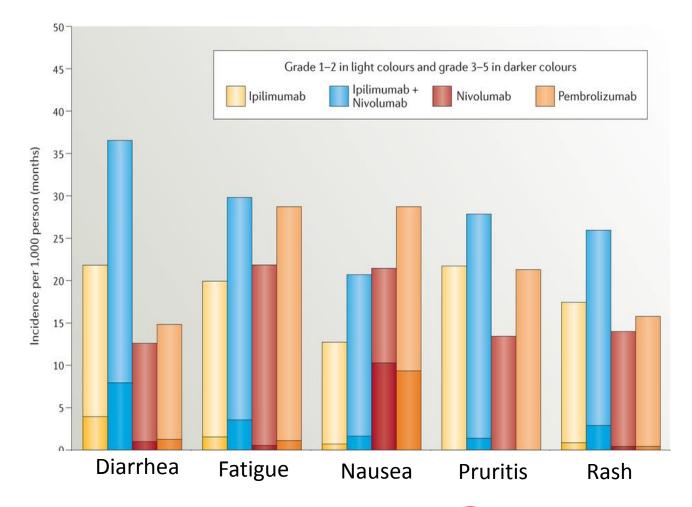

CTLA-4

Nivolumab:

→ PD-1

Pembrolizumab:

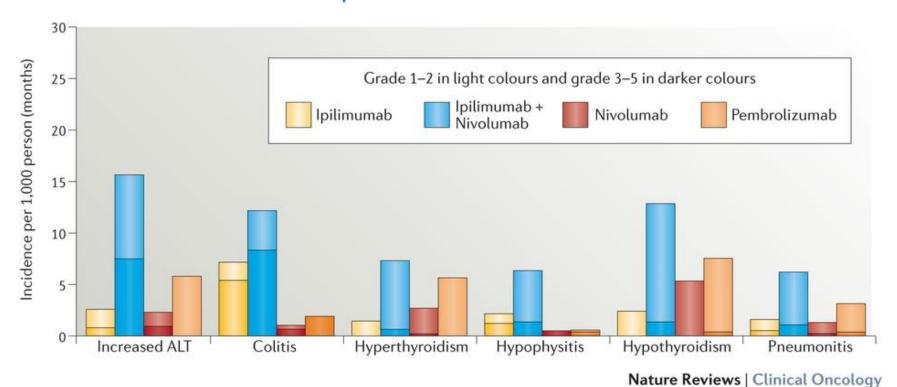

Clinical features for adverse events with immune check-point inhibitors

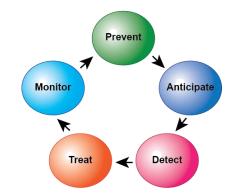

Nurse's Role: Prior to Immunotherapy

- Review & assess
 - Co-morbidities (dermatologic, endocrinopathies, gastrointestinal)
 - Medications
- Patient & family education
 - Most common side effects, including variability in the timing of onset
 - Importance of early & ongoing communication regarding side effects
 - Appropriate skin care during immunotherapy treatment, initiate now

Case Study - rash

Mr. M.C. returns to clinic for evaluation prior to dose #4 of pembrolizumab.

He reports that for the past week he has had a pruritic rash on his chest, abdomen and arms.

Managing irAEs

Table 4. Ty	Table 4. Typical management of irAEs							
Severity— CTCAE grade	Ambulatory versus inpatient care	Corticosteroids	Other immunosuppressive drugs	Immunotherapy				
1	Ambulatory	Not recommended	Not recommended	Continue				
2	Ambulatory	Topical steroids or Systemic steroids	Not recommended	Suspend temporarily ^a				
3	Hospitalization	oral 0.5–1 mg/kg/day Systemic steroids Oral or i.v. 1–2 mg/kg/day for 3 days then	To be considered for patients with unresolved symptoms after 3–5 days of steroid course	Suspend and discuss resumption based on risk/benefit ratio with patient				
4	Hospitalization consider intensive care unit	reduce to 1 mg/kg/day Systemic steroids i.v. methylprednisolone 1–2 mg/kg/day for 3 days then reduce to 1 mg/kg/day	Organ Specialist referral advised To be considered for patients with unresolved symptoms after 3–5 days of steroid course Organ specialist referral advised	Discontinue permanently				

CTCAE = Common Terminology Criteria for Adverse Events

Champiat S, et al, Ann Oncol, 2016

Adverse Events

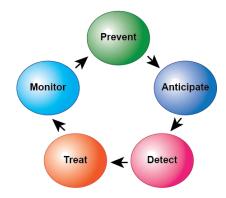

Nurse's role: rash

Anticipate/Prevent

- Skin toxicities can be seen in up to 58% of cases
- Autoimmune conditions can worsen
- Occupational/recreational activities (exposure to outdoors/high temps can worsen skin AEs)
- Possibility of developing hypopigmentation (vitiligo correlated to positive outcome)

Monitor

- New onset of rash
- New lesions
- Itching
- Sunburn
- Photosensitivity

Manage

- Educate patient about potential side effects
- Grade 1: topical OTC hydrocortisone / oral diphenhydramine
- Grade 1/2: triamcinolone or clobetasol cream, diphenhydramine or hydroxyzine (if and when)
- Grade 2: hold treatment, oral corticosteroids
- Grade 3/4: discontinue agent

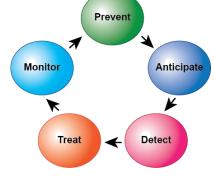

Nurse's role: rash

Anticipate/Prevent

- Skin toxicities can be seen in up to 58% of cases
- Autoimmune conditions can worsen
- Occupational/recreational
 activities /expenses to

Nurse's role: GI toxicities

Anticipate/Prevent

- Diarrhea can be seen in up to 48% of cases
- Autoimmune conditions can worsen
- Avoid foods that cause loose stools
- Rule out infections (c-diff)
- Remain well-hydrated

Monitor

- Worsening loose stools
- Dehydration
- Abdominal pain/cramping
- Bloody stools

Manage

- Educate patient about potential side effects
- Grade 1: hydration, loperamide, bland diet
- Grade 2:
 diphenoxylate/atropine QID,
 budesonide, stool studies,
 possible
 sigmoidoscopy/colonoscopy
 & steroid taper
- Grade 3/4: discontinue agent, IV steroids and fluids (if not effective, infliximab)

Case study

- B.C. is 56-year-old female with a diagnosis of Stage IV melanoma. She is now on nivolumab 240 mg every two weeks infused over 60 minutes. Today she reports that for the past five days she has had SOB, cough and DOE.
- O² saturations at RA 95% and 89% during ambulation
- As the primary nurse, what would be your best course of action?

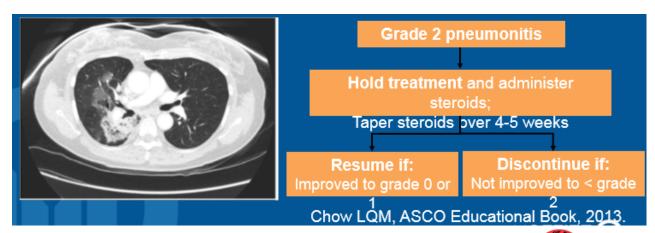

Pneumonitis is more common with anti-PD1/CTLA-4 combination therapy

- Important to address respiratory symptoms and check oxygen saturations at each visit
- On any patients where pneumonitis is suspected based on H&P or clinical exam, provider will hold treatment and order a CT scan of the chest.
- Specific management is necessary for grade 2 or greater pneumonitis.

Nurse's role: pneumonitis

Monitor

 Pneumonitis on single vs combination immunotherapy

Anticipate/Prevent

- Exposure to heavy smoke areas / smoking cessation
- Vaccinations (flu + pneumonia
- Pneumonia vs PE vs CHF

- SOB, DOE, CP, persistent cough, fevers, worsening fatigue
- Pulse-ox at rest and ambulation

Manage

Prevent

Anticipate

Detect

 Educate patient about potential side effects

Monitor

- Grade 1: asymptomatic
- Grade 2: chest x-ray or CT, anticipate steroid taper
- Grade 3/4: discontinue agent, IV steroids and fluids (if not effective, infliximab), oxygen therapy

Case study

- J.C. is a 75-year-old male with metastatic melanoma currently on nivolumab/ipilimumab combination therapy. He reports that for the past five days he has had:
 - Moderate headaches, severe fatigue, weakness and nausea.
 - Endocrine labs revealing low cortisol, low ACTH and low testosterone levels. Free T4 and TSH were normal.
- As the nurse you see the patient first in clinic and alert the doctor of his symptoms and current labs.

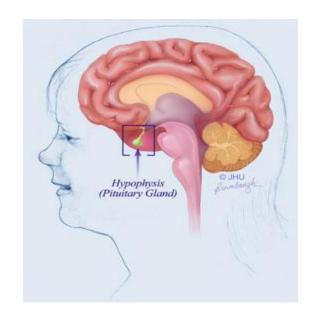

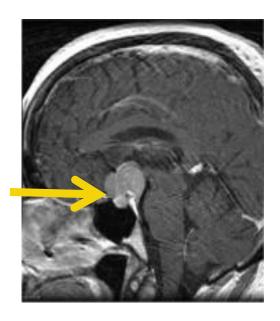

Case study

Oncologist orders an MRI of the brain which shows inflammation of the pituitary gland

Immune-mediated endocrinopathies

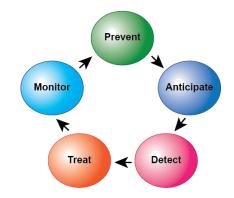

- More common with anti-PD-1 than anti CTLA-4
- Hypophysitis with nivo/ipi median time to onset was about 2.7 months. All grades 9%
- Hypothyroidism
- Hyperthyroidism
- Adrenal insufficiency
 - Rule out brain metastasis
 - Hold for symptoms and/or any Grade 3/4
 - Give steroids (IV followed by PO 1-2mg/kg) tapered over four weeks and replace appropriate hormones
 - Hormone replacement may be required for life in ~50% of patients

Nurse's role: endocrinopathies

Anticipate/Prevent

- Hypothyroidism
- Hyperthyroidism
- Hypophysitis
- Adrenal insufficiency
- Especially in combination ipi/nivo

Monitor

- Labs: Free T4, TSH, ACTH, cortisol and testosterone (in males)
- Worsening fatigue
- Constipation
- Headaches
- Dizzy episode(s)
- Muscle weakness

Manage

 Hormonal replacement therapy or steroid taper accordingly

Immune checkpoint inhibitors irAEs

- Rare toxicities
 - Type I and II diabetes mellitus
 - Pancreatitis-usually asymptomatic amylase/lipase elevations (hold for grade 3/4)
 - Myositis
 - Renal toxicity (acute interstitial nephritis)
 - Autoimmune myocarditis
 - Bullous pemphigoid

Immune checkpoint inhibitors irAEs

Rare toxicities

Bullous pemphigoid

- Myasthenia-like syndrome-motor paralysis, intravenous immune globulins
- Optic neuritis-photophobia, pain, blurred vision, may correlate with colitis
- Sarcoidosis-lymphadenopathy, increased angiotensin converting-enzyme level, biopsy is granulomata, PET positive
- Hematologic
- Cardiotoxicities: Myocarditis

Immune-mediated toxicities

- General principles of toxicity management
 - Reversible toxicities when recognized quickly and treated appropriately
 - Treatment may include dose delay, omission, or discontinuation, corticosteroids, tumor necrosis alfa (TNF-α) antagonists, and mycophenolate mofetil
 - Corticosteroids may require a long tapering duration to prevent recurrence of symptoms
 - Rechallenge with checkpoint inhibitor may only be done, if clinically appropriate, once a patient is receiving 10 mg of oral prednisone or equivalent or less.
 - Prolonged use of steroids predisposes patients to systemic infection so prophylaxis may be indicated.

Villadolid J and Amin A. *Transl Lung Cancer Res* 2015; 4 (5): 560-575

Conclusions

- Nurses have an ESSENTIAL role in monitoring and managing patients undergoing treatment with immunotherapy.
- Potential irAEs grade 2 and above require frequent visits, drug hold/discontinuation and corticosteroids.
- Combination anti-PD-1/CTLA-4 immunotherapy significantly increases the grade 3-4 AE rate.
- Close monitoring for irAEs is mandatory for prevention of serious adverse events, decreased ER visits and improved patient outcomes.
- As immunotherapies indications broaden, our understanding of toxicity identification and management is essential to make the risk-benefit ratio favorable.
