Immunotherapy for Metastatic Kidney Cancer (Renal Cell Carcinoma; RCC)

reemakeup.blogspot.com

History of Immunotherapy in mRCC

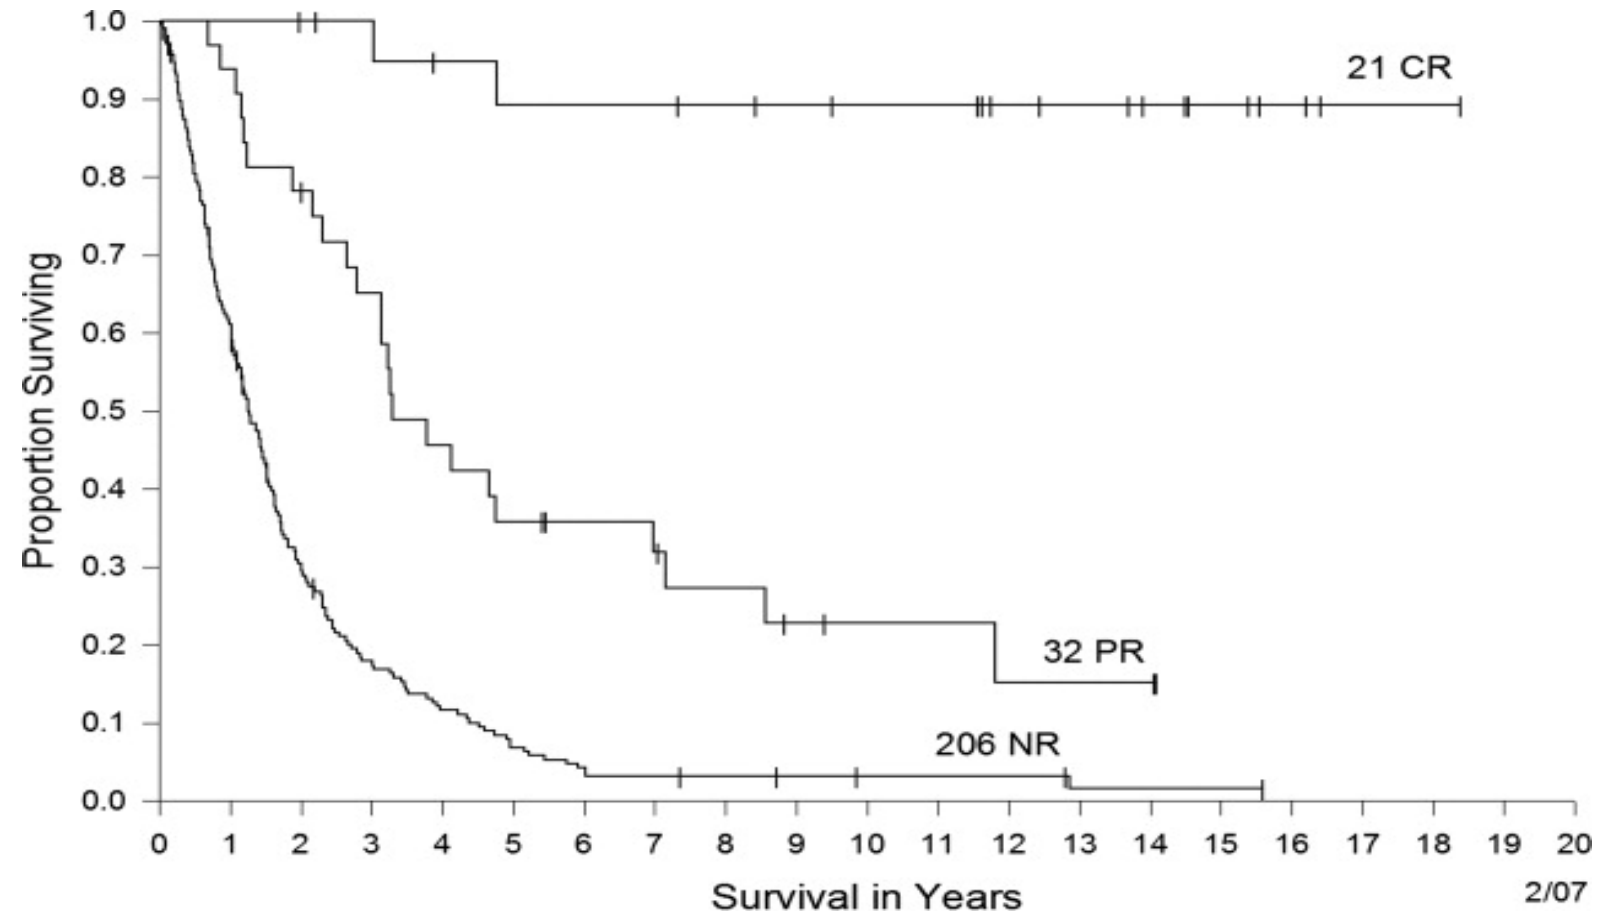

FDA-approved Immunotherapies for mRCC

Drug	Approved	Indication	Dose
High dose Interleukin-2	1992	Metastatic RCC	600,000 International Units/kg (0.037 mg/kg) IV q8hr infused over 15 minutes for a maximum 14 doses, THEN 9 days of rest, followed by a maximum of 14 more doses (1 course)*
Interferon-α (with bevacizumab)	2009	Clear cell RCC***	9 MIU s.c. three times a week
Nivolumab	2015	Clear cell RCC Refractory to prior VEGF Targeted therapy	3mg/kg 240mg IV q 2 week or 480mg IV q 4 wks
Nivolumab +ipilimumab	2018	Clear cell RCC, treatment naïve	3mg/kg nivo plus 1mg/kg ipi q3 wks x 4 doses then nivo maintenance at flat dosing

*Retreatment: Evaluate after 4 weeks, advisable only if tumor shrinkage and no retreatment contraindications (see package insert for details)

High Dose IL-2 in mRCC

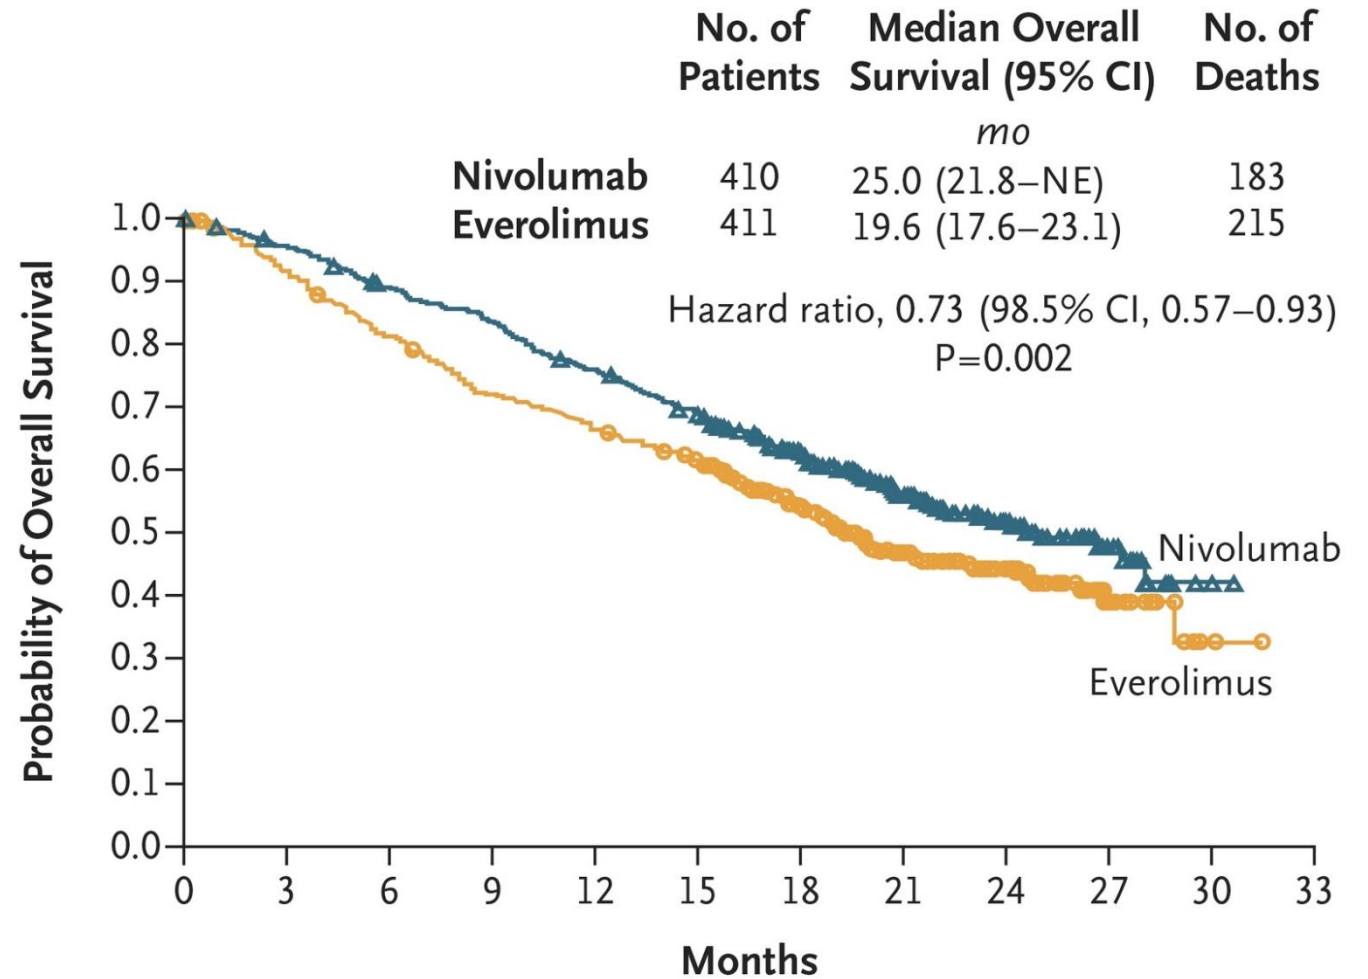

- 20 year analysis of 259 patients
- ORR = 20%
 - 9% CR (n = 23)
 - 12% PR (n = 30)
- Median duration of response = 15.5 months
- Median OS = 19 months

Klapper et al. Cancer 2008

Second-Line Nivolumab in mRCC

- CheckMate 025 Phase III trial
- Nivolumab = anti-PD-1 antibody
- Metastatic, clear-cell disease
- One or two previous antiangiogenic treatments
- Nivolumab (3 mg/kg IV Q2W) vs everolimus (10 mg daily)

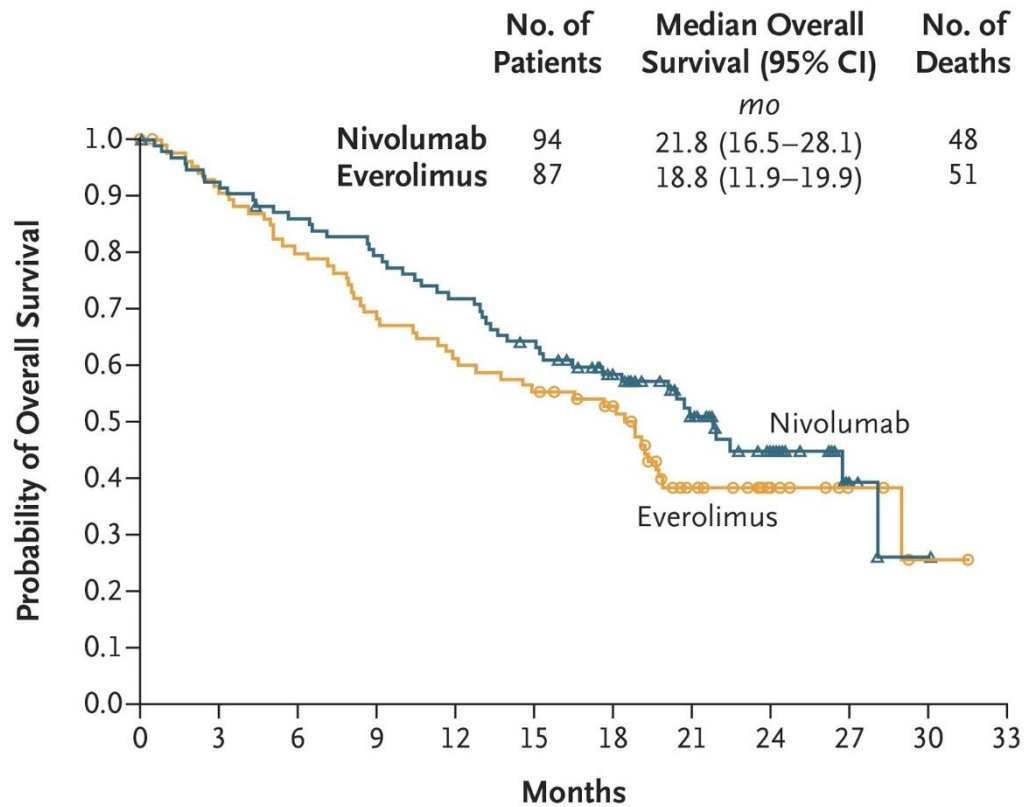

Motzer et al. NEJM 2015

Second-Line Nivolumab in mRCC

PD-L1 subgroups

PD-L1 ≥ 1%

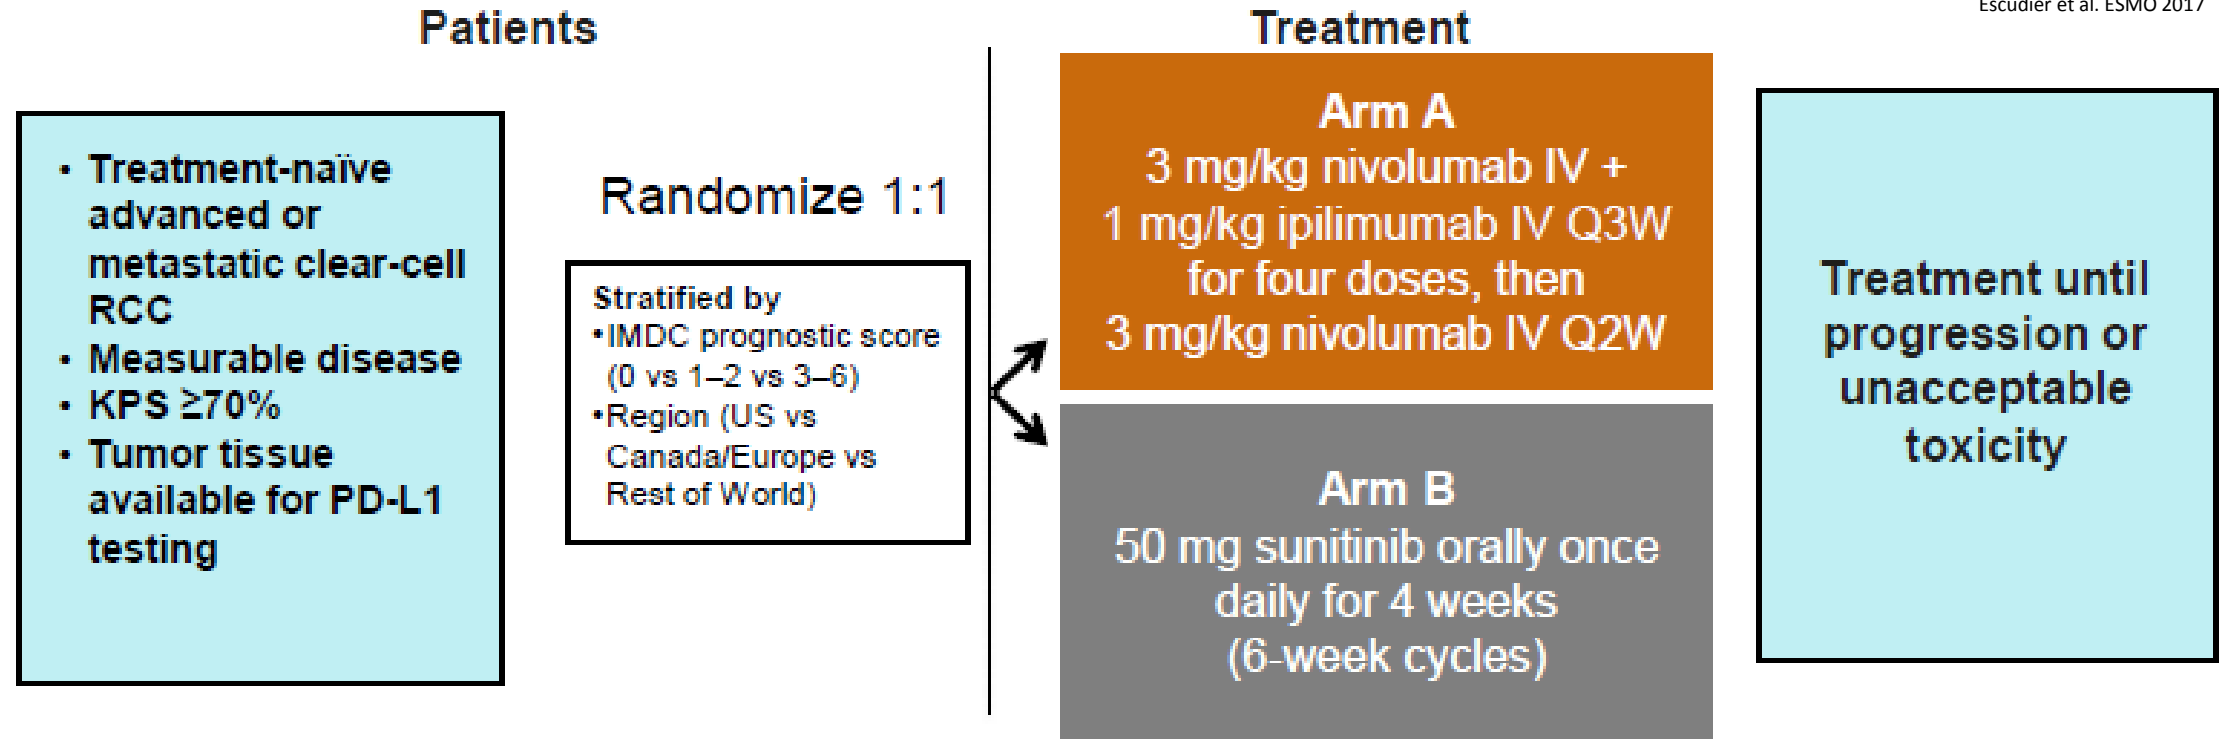

PD-L1 < 1%

Motzer et al. NEJM 2015

First-line Nivolumab + Ipilimumab in mRCC

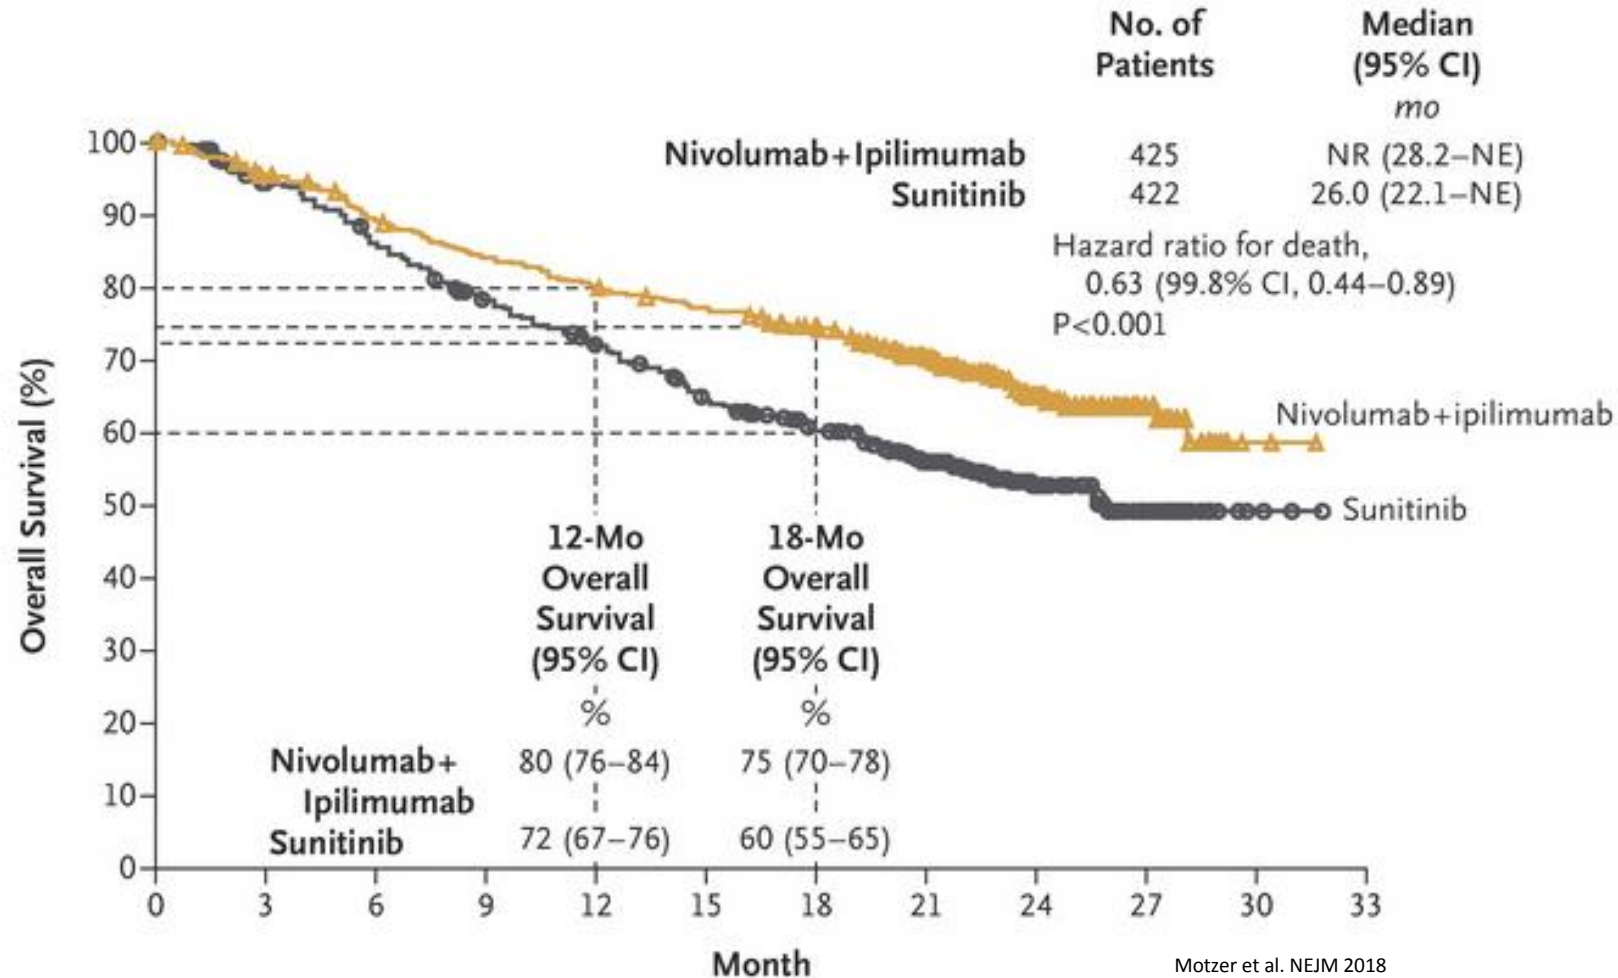

Escudier et al. ESMO 2017

Nivolumab = anti-PD-1 antibody

Ipilimumab = anti-CTLA-4 antibody

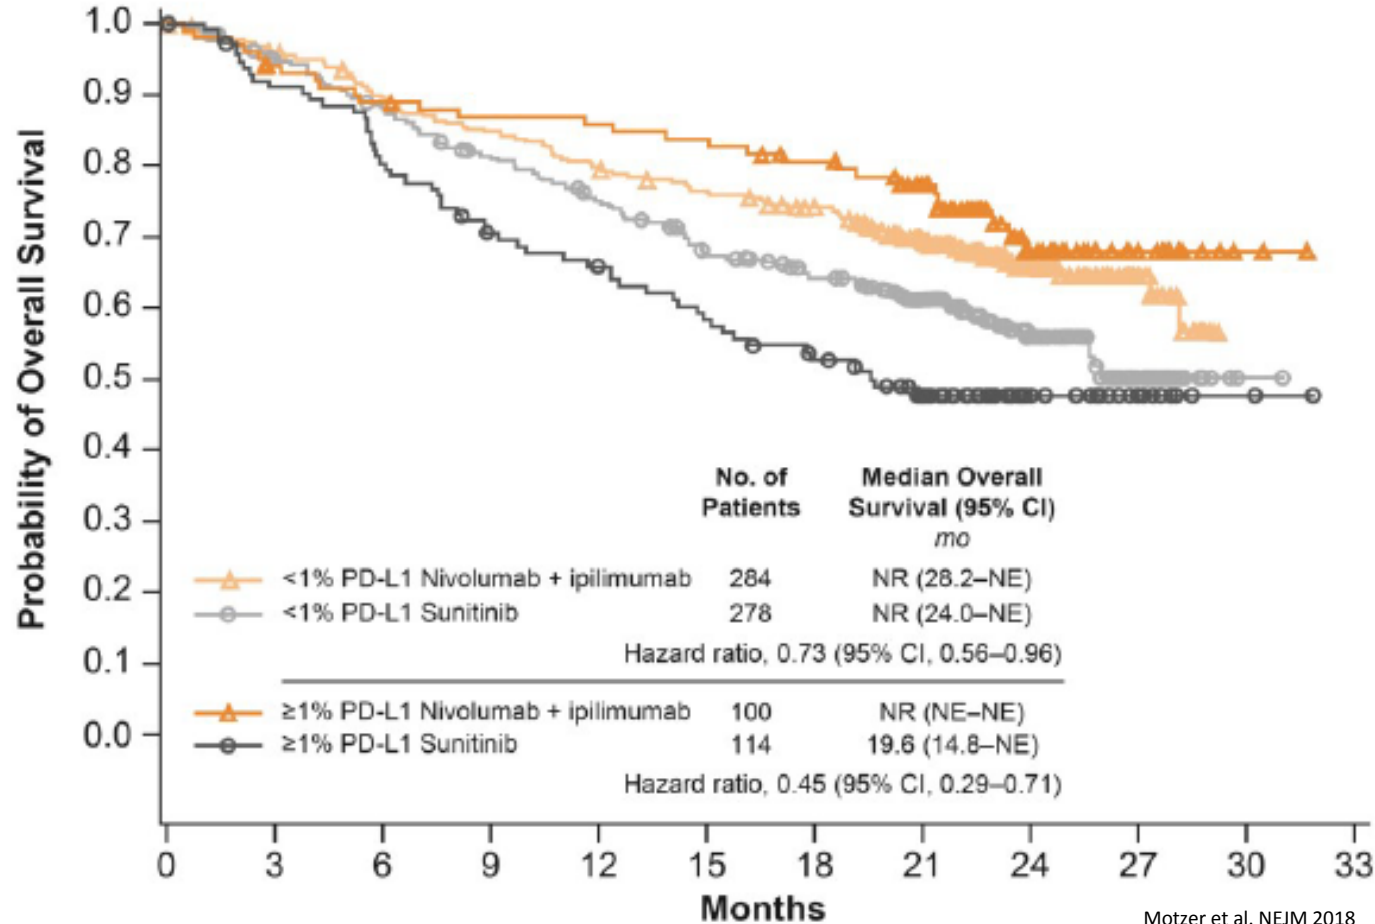

First-line Nivolumab + Ipilimumab in mRCC

Motzer et al. NEJM 2018

First-line Nivolumab + Ipilimumab in mRCC

PD-L1 Subgroups

Motzer et al. NEJM 2018

In Development: First-line Atezolizumab + Bevacizumab in PD-L1+ mRCC

Motzer et al. ASCO GU 2018
 Escudier et al. ASCO 2018

In Development: First-line Checkpoint Inhibitors + Axitinib in mRCC

JAVELIN Renal 101

Motzer et al. ESMO 2018

- KEYNOTE-426
 - Pembrolizumab + axitinib in mRCC
 - Positive for OS and PFS (10/18/2018)

In Development: First-line Pembrolizumab in mRCC

KEYNOTE - 427

	N = 110
Confirmed ORR, % (95% CI)	38 (29 – 48)
Confirmed BOR, n (%)	
CR	3 (3)
PR	39 (35)
SD	35 (32)
PD	31 (28)
No assessment	2 (2)

Donskov et al. ESMO 2018

Immunotherapy for Metastatic Bladder Cancer (Urothelial Carcinoma; UC)

Approved Checkpoint Inhibitors for mUC

Cisplatin Refractory

Drug/Trial name	Phase	No. of patients	ORR	PFS	OS	Duration of response	Grade 3/4 AE (treatment related deaths)	Maximal duration of treatment
CISPLATIN REFRACTORY								
Atezolizumab IMvigor210 cohort 2	II	310	16% (6% CR)	2.1 mo	7.9 mo (1yr 29%)	22.1 mo	18% (0 deaths)	NR
Atezolizumab IMvigor211	III	931	13%	NR	8.6 mo	21.7 mo	20%	NR
Pembrolizumab KEYNOTE-045	III	542	21%	2.1 mo	10.3 mo	NR	14% (4 deaths)	2 years
Nivolumab CheckMate275	II	265	19.6% (2% CR)	2 mo	8.7 mo	NR	18% (3 deaths)	NR
Avelumab JAVELIN	Ib	242*	17% (6% CR)	6.6 weeks	6.5 mo	NR	10% (1 death)	NR
Durvalumab	I/II	191	17.8% (4% CR)	1.5 mo	18.2 mo	NR	7% (2 deaths)	1 year

Anti-PD-L1 Antibodies

- 1) Atezolizumab
- 2) Avelumab
- 3) Durvalumab

Anti-PD-1 Antibodies

- 1) Nivolumab
- 2) Pembrolizumab

In development: Combinations

- 1) IO + IO
- 2) IO + Chemotherapy

Approved Checkpoint Inhibitors for mUC

Cisplatin Ineligible

CISPLATIN INELIGIBLE								
Atezolizumab IMvigor210 cohort 1	II	119	23% (9% CR)	2.7 mo	15.9 mo, 1yr 57%	NR	16% (1 death)	NR
Pembrolizumab KEYNOTE-052	II	370	29% (7% CR)	6mo 30%	6 mo 67%	NR	19% (1 death)	2 years

Anti-PD-L1 Antibodies

- 1) Atezolizumab
 - PD-L1 stained tumor-infiltrating immune cells [IC] covering $\geq 5\%$ of the tumor area

Anti-PD-1 Antibodies

- 1) Pembrolizumab
 - PD-L1 CPS ≥ 10

In development: Combinations

- 1) IO + IO
- 2) IO + Chemotherapy

Tumor Mutational Burden (TMB) May Signal Responses with PD-1 Blockade

Atezolizumab in mUC

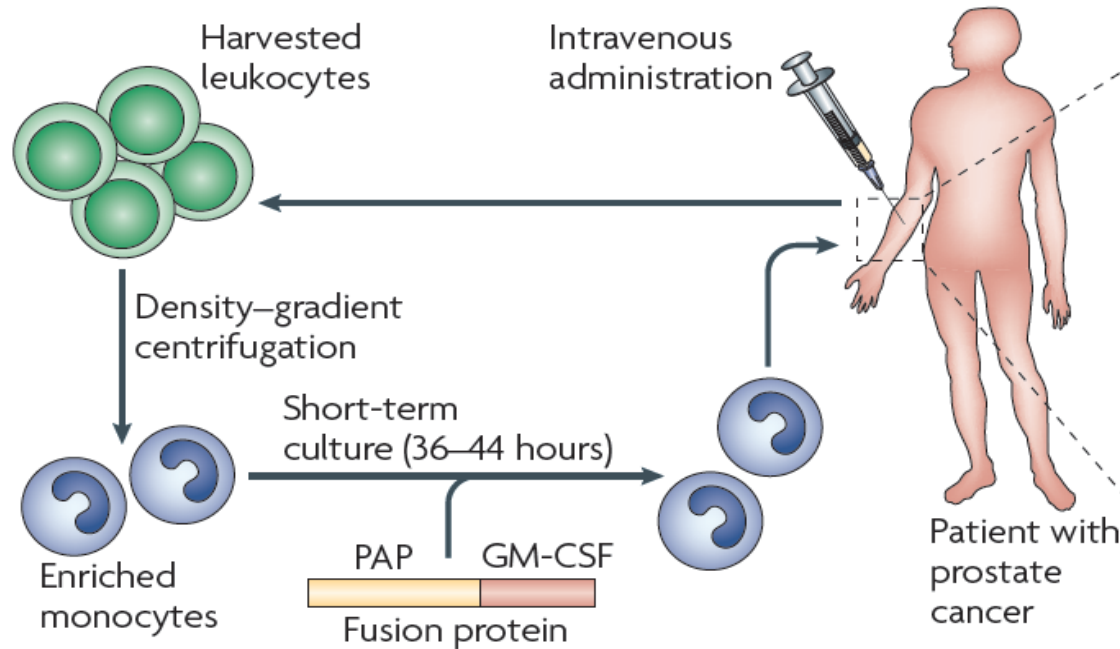

Rosenberg et al. Lancet 2016

The Spectrum of Prostate Cancer

Sipuleucel-T in mCRPC

- First anticancer therapeutic vaccine

Drake et al. Curr Opin Urol 2010

Kantoff et al. NEJM 2010

Limited efficacy of Checkpoint Inhibitors in mCRPC

No FDA-approved CIs for mCRPC

Ex. – KEYNOTE-199 (Pembrolizumab)

DeBono et al. ASCO 2018

- Pembrolizumab is approved for all Microsatellite Instability-High (MSI-H) solid tumors
- MSI-H incidence is low in PC
 - Localized PC ~2%
 - Autopsy series of mCRPC ~12%
- MSI testing may offer pembrolizumab as an option

Future Combinations in mCRPC to Engage Immune System

- Hormonal therapy
- Radiation
- Radium-223
- PARP inhibitors
- Chemotherapy
- New targets

Stein et al. Asian J Andrology 2014

irAEs with Immune Checkpoint Inhibitors in GU Cancers

Meta-analysis of 8 studies

- Similar incidence overall

Adverse event	Incidence, any grade (GU only trials) (%)	Incidence, grades 3–5 (GU only trials) (%)	Incidence any grade (non-GU clinical trials) (%)	Incidence, grades 3–5 (non-GU clinical trials) (%)
Hypothyroid/thyroiditis	0.8–9	0–0.6	3.9–12	0–0.1
Diabetes/DKA	0–1.5	0–0.7	0.8–0.8	0.4–0.7
LFT changes/hepatitis	1.5–5.4	1–3.8	0.3–3.4	0.3–2.7

Immune-related Adverse Events

Table 2 General guidance for corticosteroid management of immune-related adverse events

Grade of immune-related AE (CTCAE/equivalent)	Corticosteroid management	Additional notes
1	<ul style="list-style-type: none"> Corticosteroids not usually indicated 	<ul style="list-style-type: none"> Continue immunotherapy
2	<ul style="list-style-type: none"> If indicated, start oral prednisone 0.5-1 mg/kg/day if patient can take oral medication. If IV required, start methylprednisolone 0.5-1 mg/kg/day IV If no improvement in 2–3 days, increase corticosteroid dose to 2 mg/kg/day Once improved to ≤grade 1 AE, start 4–6 week steroid taper 	<ul style="list-style-type: none"> Hold immunotherapy during corticosteroid use Continue immunotherapy once resolved to ≤grade 1 and off corticosteroids Start proton pump inhibitor for GI prophylaxis
3	<ul style="list-style-type: none"> Start prednisone 1-2 mg/kg/day (or equivalent dose of methylprednisolone) If no improvement in 2–3 days, add additional/alternative immune suppressant Once improved to ≤ grade 1, start 4–6-week steroid taper Provide supportive treatment as needed 	<ul style="list-style-type: none"> Hold immunotherapy; if symptoms do not improve in 4–6 weeks, discontinue immunotherapy Consider intravenous corticosteroids Start proton pump inhibitor for GI prophylaxis Add PCP prophylaxis if more than 3 weeks of immunosuppression expected (>30 mg prednisone or equivalent/day)
4	<ul style="list-style-type: none"> Start prednisone 1-2 mg/kg/day (or equivalent dose of methylprednisolone) If no improvement in 2–3 days, add additional/alternative immune suppressant, e.g., infliximab Provide supportive care as needed 	<ul style="list-style-type: none"> Discontinue immunotherapy Continue intravenous corticosteroids Start proton pump inhibitor for GI prophylaxis Add PCP prophylaxis if more than 3 weeks of immunosuppression expected (>30 mg prednisone or equivalent/day)

Case Study 1

Cancer History

- 74 year old man who presented with hematuria and a left renal mass in May 2014. Clinical diagnosis was primary renal cancer. Imaging showed no metastatic disease.
- Initial therapy was left radical nephrectomy. Pathology revealed high grade urothelial carcinoma measuring 5.8 cm. One of 12 regional lymph nodes contained carcinoma (pT4pN1M0, stage IV).
- Post surgical adjuvant gemcitabine and cisplatin were administered x 4 cycles.

Cancer History continued...

- The patient did well until July, 20 2015 when imaging revealed:

Biopsy confirms metastatic urothelial carcinoma

Cancer History continued...

- Patient enrolled in the BMS CA209-275 clinical trial
 - Nivolumab administered at 3 mg/kg IV every 2 weeks
 - Response:

Other Events...

- Nivolumab resulted in:
 - Pneumonitis that appeared after ~9 months of therapy and required high dose steroids with a slow taper.
 - The radiologist report interpreted this and many other scans as disease progression (beware . . .).
 - He is recurrence-free now 31 months after the last nivolumab dose.

Case Study 2

Initial Presentation

- 63 year old woman who presents with painless hematuria x 3. The patient has no other symptoms, normal labs and ECOG 0. She has a 20 pack-year smoking history and quit 5 years ago. She works in telemarketing.
 - Initial evaluation?

Case Continued

- Physical exam revealed a palpable large left renal mass.
- CT imaging showed multiple bilateral lung nodules and a 14 cm left renal mass.
 - Treatment options?

Case Continued...

- The patient had left radical nephrectomy and pathology revealed a conventional (clear cell) renal cancer measuring 14 cm and Fuhrman nuclear grade 4. One out of 7 lymph nodes contained RCC.
 - Systemic therapy options?

Case Continued...

- The patient volunteered for a clinical trial investigating SBRT + IL-2 versus IL-2. Pulmonary function tests and ETT were sufficient for high-dose immunotherapy. During the IL-2 evaluation, she presented with a left sided weakness and brain MRI showed 2 right-sided brain metastases amenable to gamma knife radiosurgery.
 - Would you still offer this patient IL-2 or another therapy?

... and then:

- She recovered from gamma knife radiosurgery, was weaned off steroids and received IL-2 (off protocol). A total of 4 cycles were administered and she achieved a partial regression of pulmonary and brain metastases, but a new lytic right femur lesion.
- RT was administered to the femur she was started on sunitinib.
- After 1 cycle of TKI there were new bone and pulmonary metastases.
- Nivolumab was started and 12 months of therapy were given. Best response was PR.
- Within 3 months of stopping nivolumab, there were new bone metastases.
- She has recently started cabozantinib and has initial regression of disease
