ADVANCES IN Cancer IMMUNOTHERAPY™

Patient Selection Criteria for Immune-Based Approaches

- Expression of the desired antigen for CAR-T therapy:
  - e.g. CD19 or BCMA for CAR-T cells
- Disease burden
  - <30% in certain CAR-T trials to minimize the risk of cytokine release syndromes
- Expression of the ligand for checkpoint inhibition
  - e.g. PD-L1 expression for anti-PD-1 therapy
- Presence of co-morbidities:
  - e.g. Presence of active autoimmune diseases which could be worsened

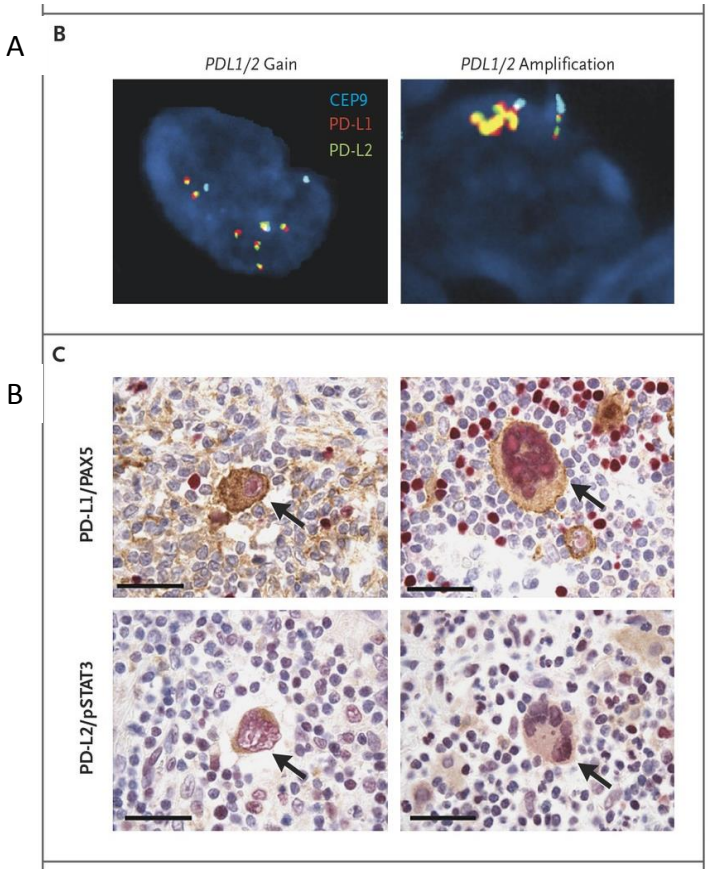
PD-L1 Expression in Hodgkin's Lymphoma

- Reed-Sternberg cells express both PD-L1 and PD-L2
- Expression of ligands increases with advanced disease
- Unclear whether PD-L1/L2 expression correlates with response to treatment



Ansell SM et al. N Engl J Med 2015;372:311-319

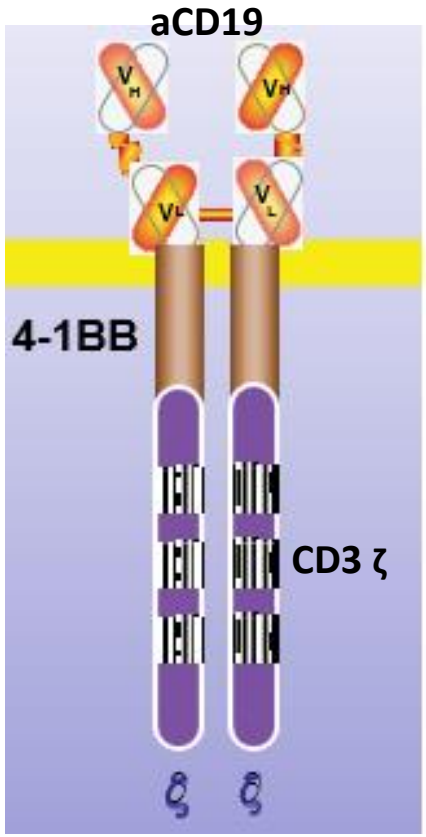
Chimeric Antigen Receptor for CD19 (CTL019)



Extracellular domain

- FMC63 **mouse** hybridoma derivative

Intracellular domain

- Fusion protein

Redirecting the Specificity of T cells

- Gene transfer technology stably expresses CARs on T cells[1,2]
- CAR T cell therapy takes advantage of the cytotoxic potential of T cells, killing tumor cells in an *antigen-dependent* manner[1,3]
- Persistent CAR T cells consist of both effector (cytotoxic) and central memory T cells[3]
- **T cells are *non-cross resistant* to chemotherapy**

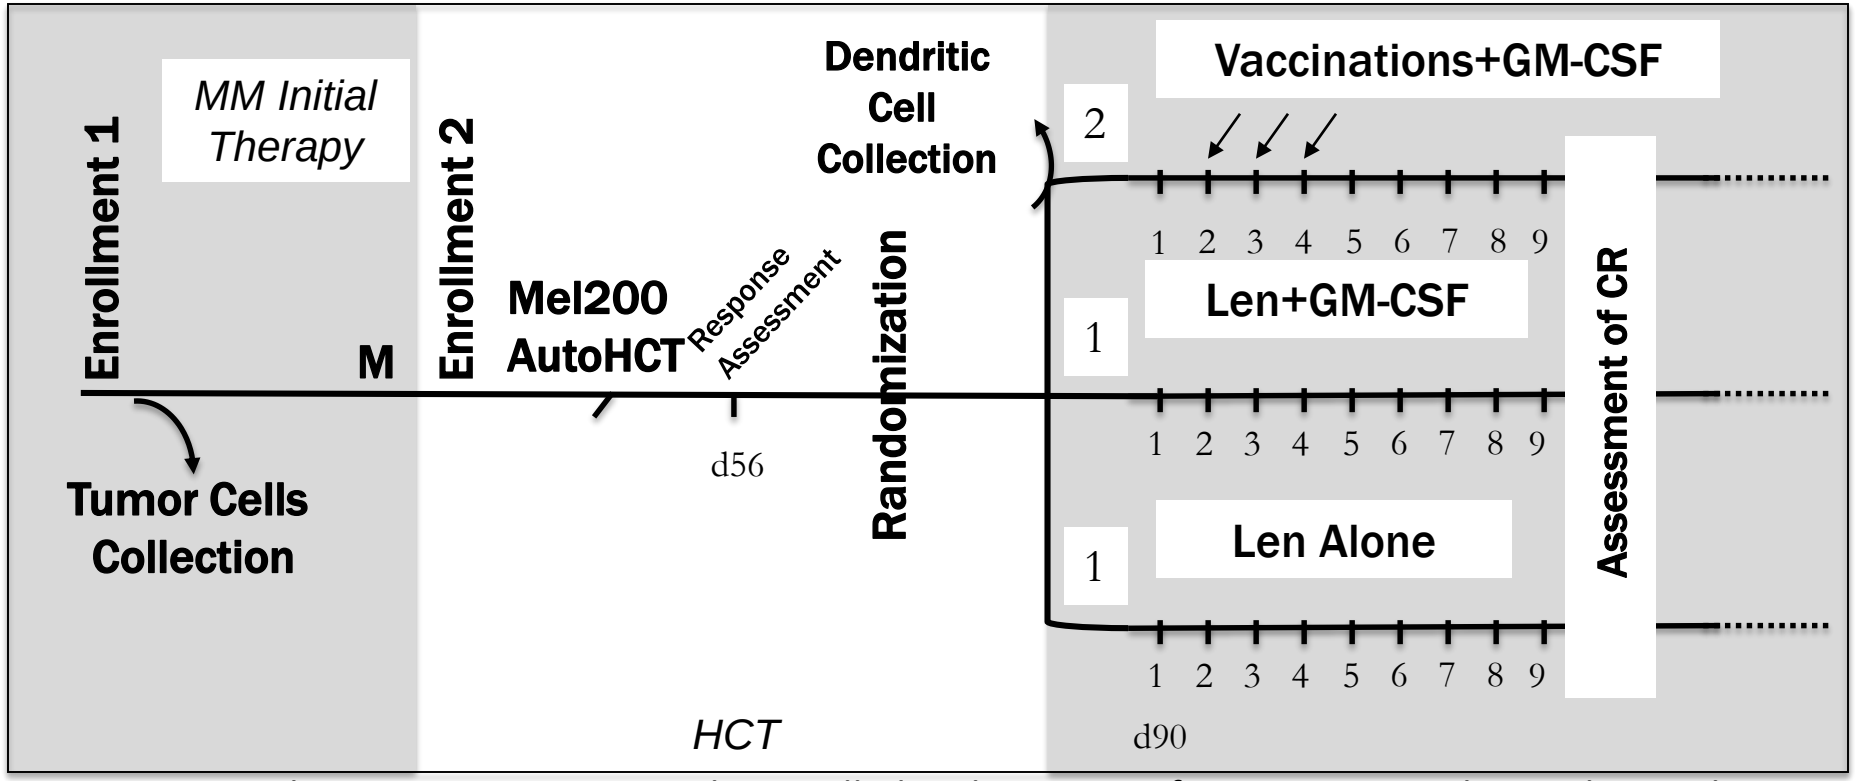
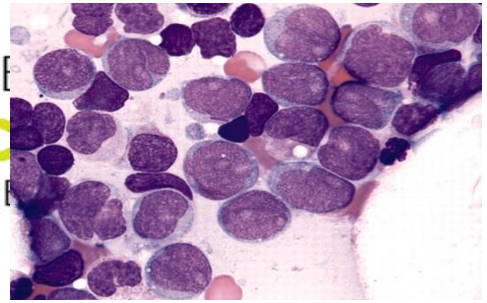
BLOOD AND MARROW TRANSPLANT CLINICAL TRIALS NETWORK

Study Schema



- Accrual targets 188 patients to be enrolled with a target of 132 patients to be randomized
- Assuming about 30% of patients are unable to proceed with post-transplant immunotherapy.
  - Arm A: Maintenance lenalidomide + vaccine + GM-CSF (n=66)
  - Arm B: Maintenance lenalidomode + GM CSF (n=33)
  - Arm C: Maintenance lenalidomide alone (n=33)

  - Patients will be stratified according to disease status at time of randomization between
  - CR and sCR and VGPR/PR/Stable disease.



Acute Myeloid Leukemia

- >50% of patients achieve remission but chemotherapy is not curative for most patients
- Outcomes are poor for patients over age 60
