Cell signaling through Notch receptors

-Notch signaling controls differentiation, proliferation, and apoptotic events in several tissues.

Regulation of T cell maturation and function by Notch signaling

- Notch signaling regulates T cell development/maturation.
- Notch plays a key role in the generation of Th1, Th2, Th17, and Treg.

Radtke F et al. *Nature Reviews Immunology*. (2013)

Nature Reviews | Immunology

Effect of Notch in CD8⁺ T cell function

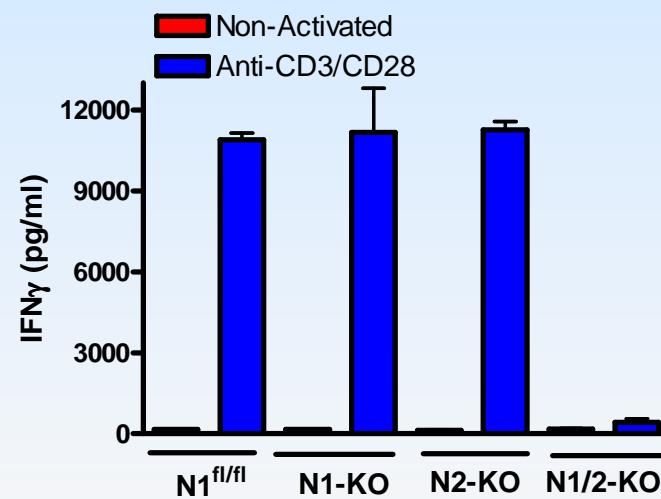

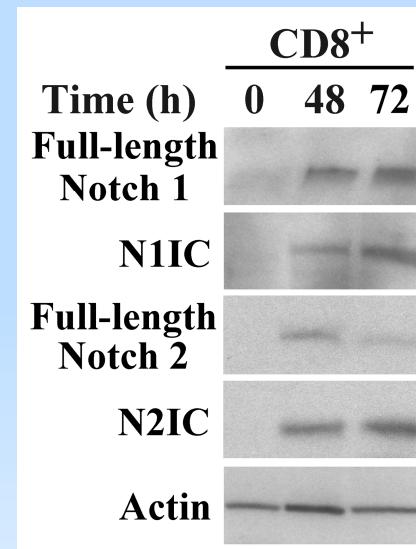

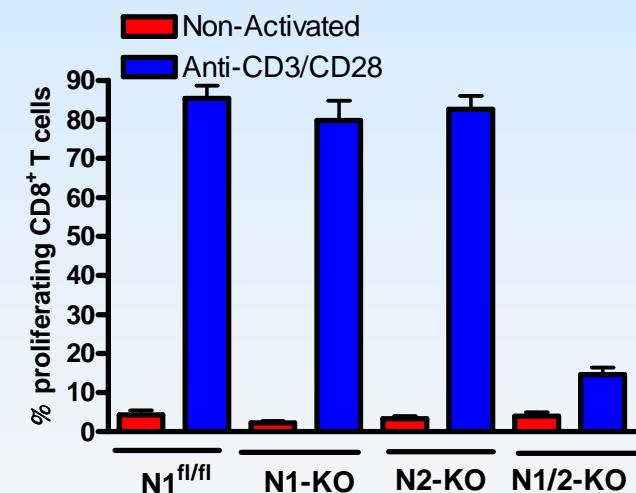

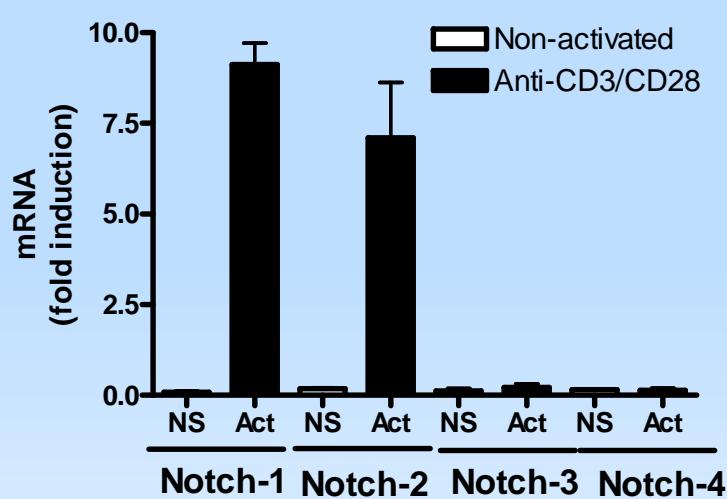

-Notch regulates function of CD8⁺ T cells:

- * Gamma secretase inhibitors (GSI).
- * Anti-sense Notch 1 mouse, Conditional KO Notch 2, Agonistic Antibodies against Notch 1 and 2.
- * Fc-fused ligands (DLL1, DLL4), Expression DLL1/4 in DC's.
- * DN-MAML and RBPJ KO.

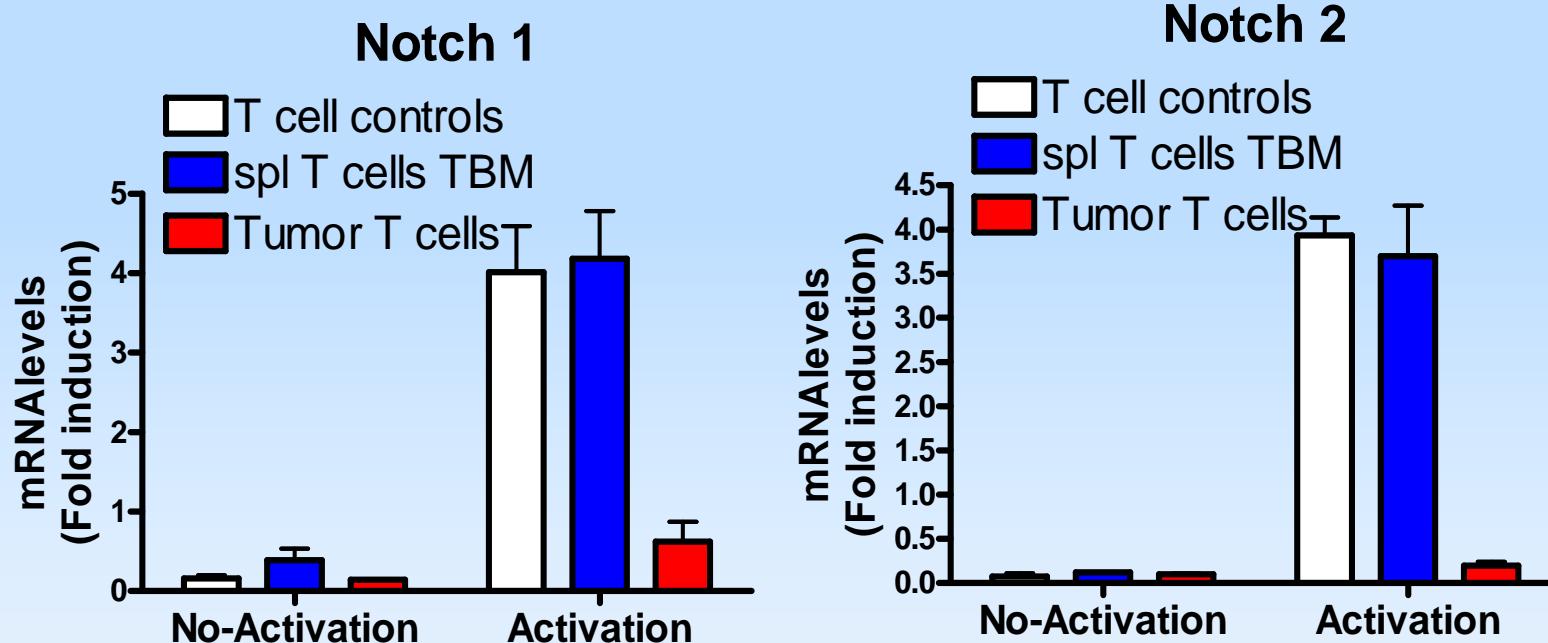

Gap of knowledge

- The role of Notch signaling in the suppression of T cell responses in tumor-bearing hosts.
- Effect of the rescue of T cell-Notch signaling in anti-tumor T cell responses (Adoptive cellular immunotherapy).

CD8⁺ T cell activation induces the expression of Notch 1 and Notch 2

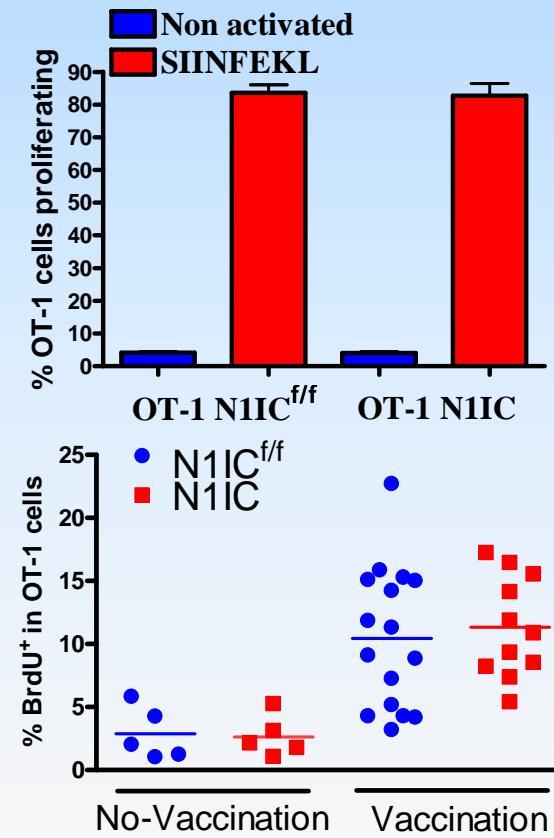

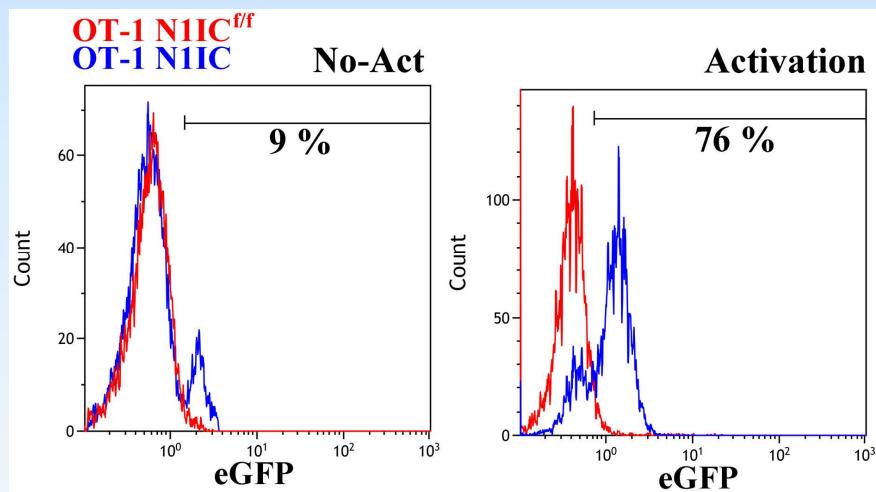

Decreased expression of Notch 1-2 in tumor-infiltrating CD8⁺ T cells

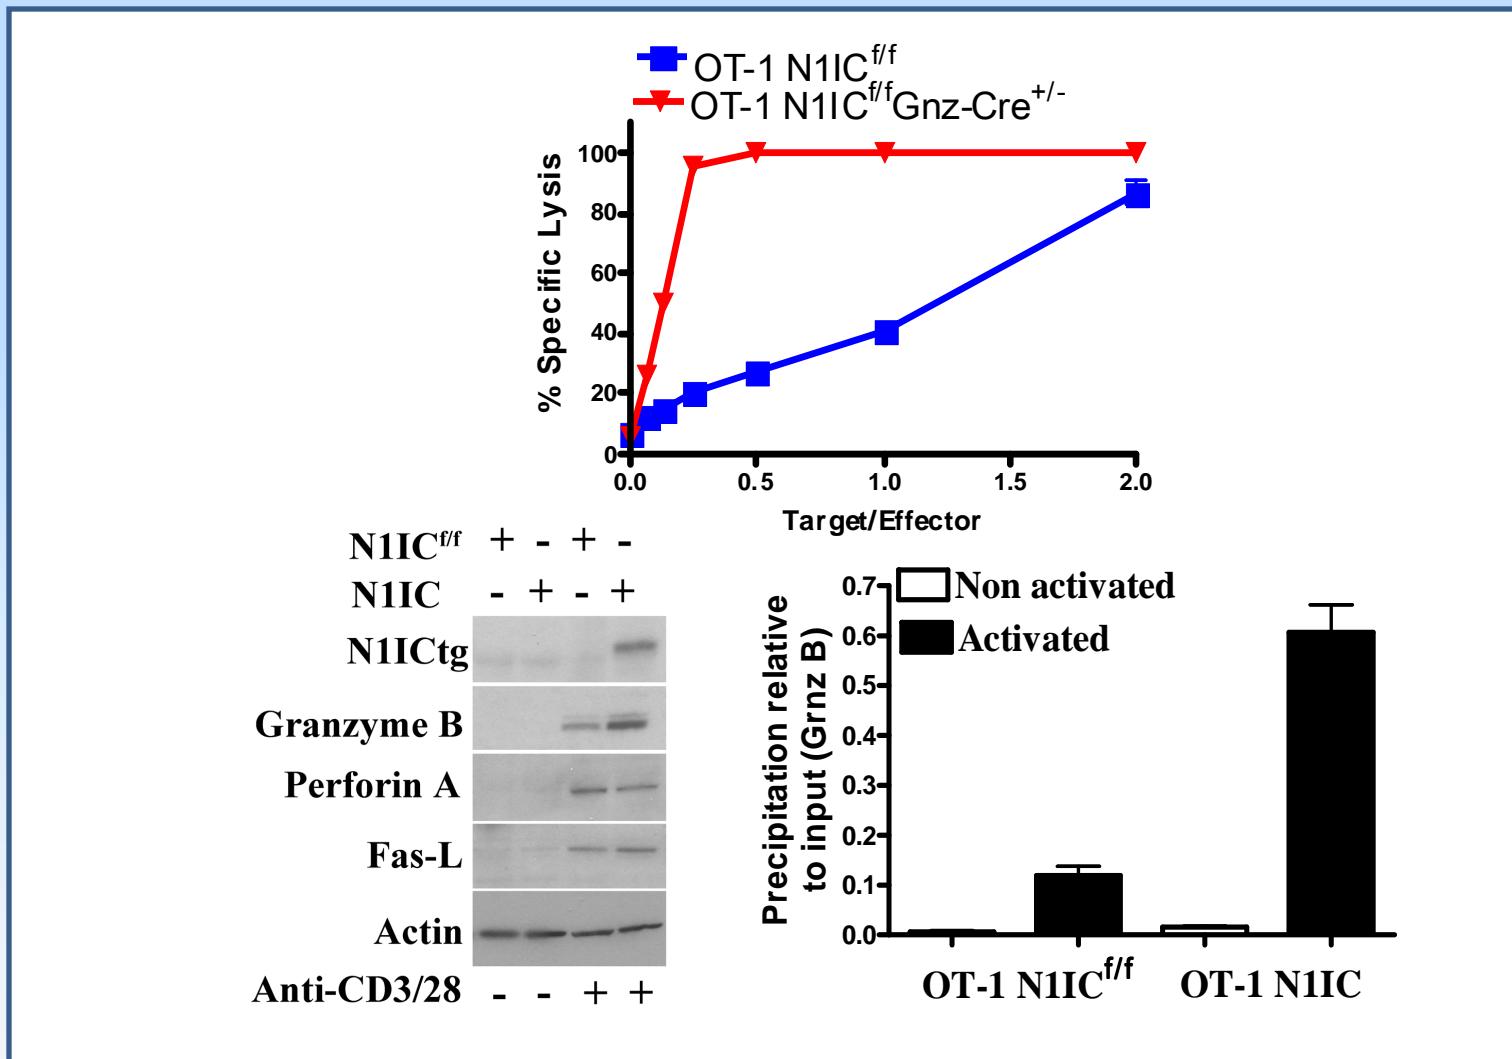

Generation of conditional N1IC transgenic mice in activated antigen-specific CD8⁺ T cell

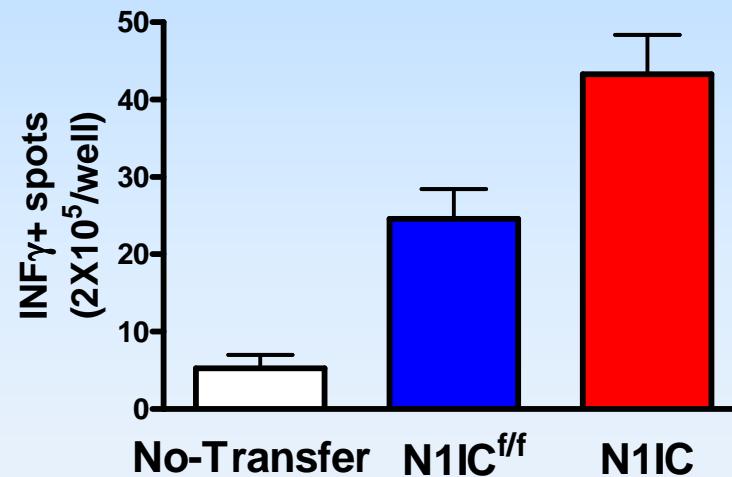

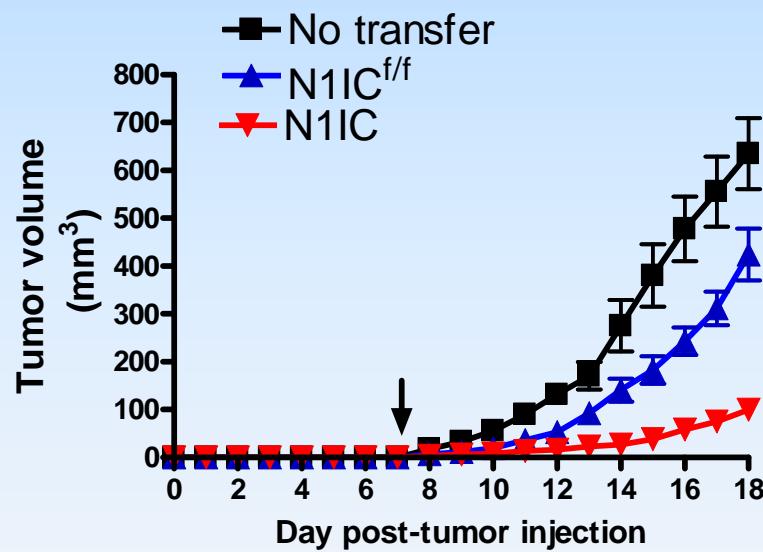

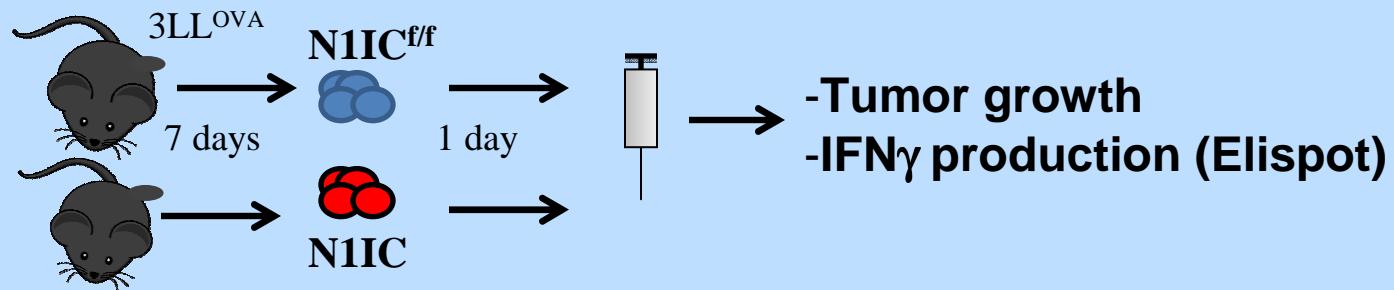

Melton D. PNAS. 9; 100:1490

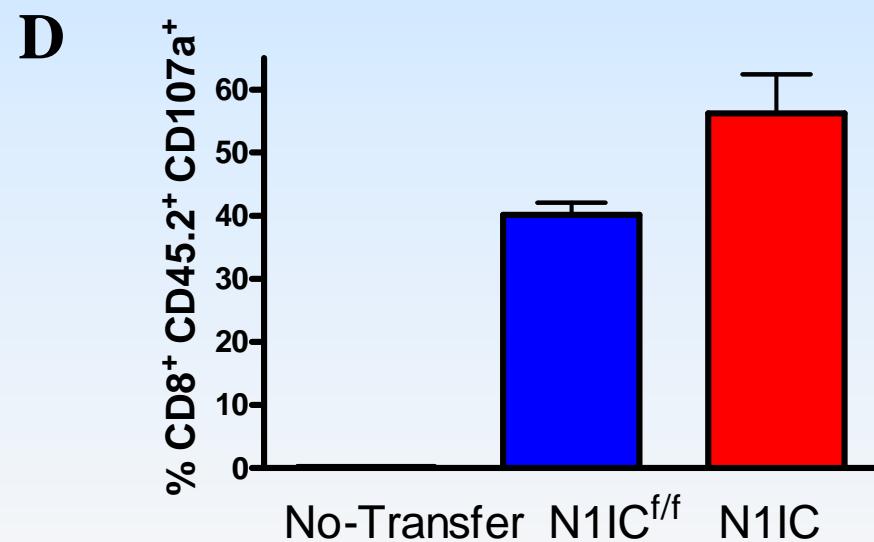

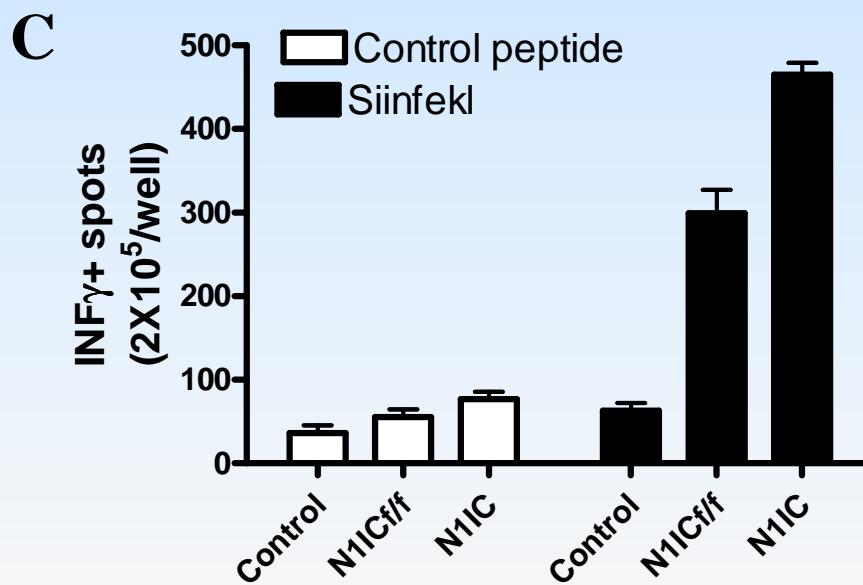

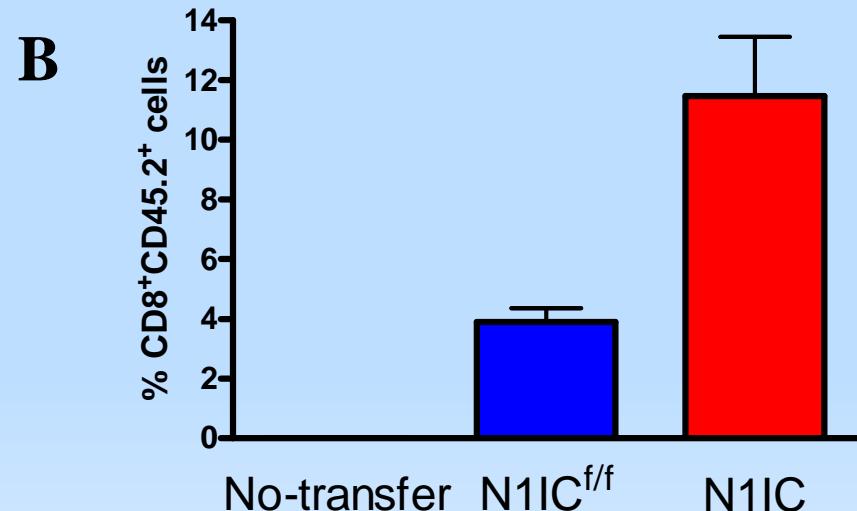

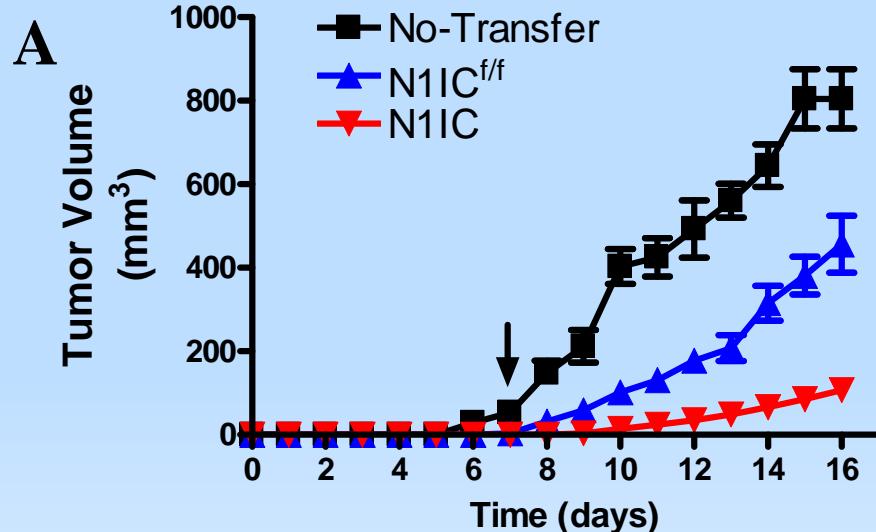

N1IC endogenously promotes CD8⁺ T cell cytotoxicity

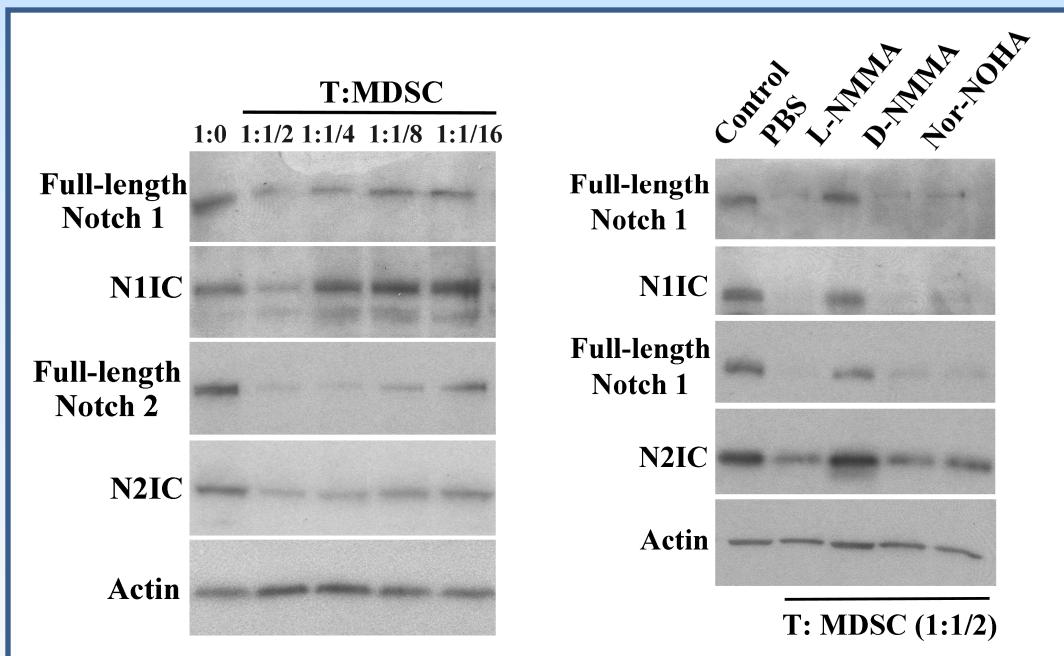

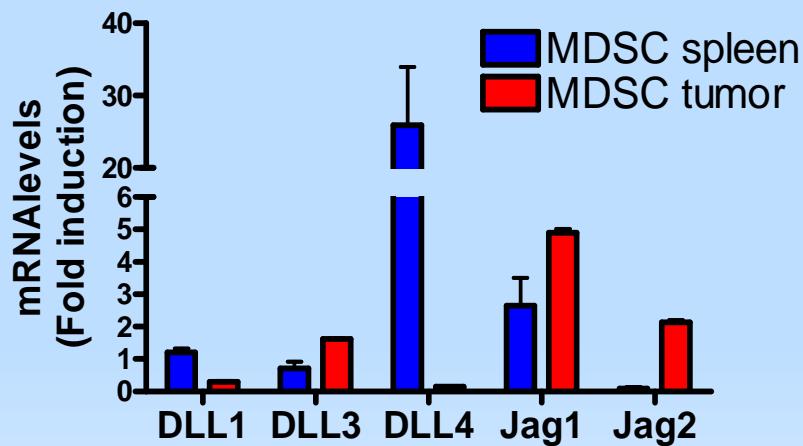

Transgenic N1IC increases anti-tumor efficacy of antigen-specific CD8⁺ T cells

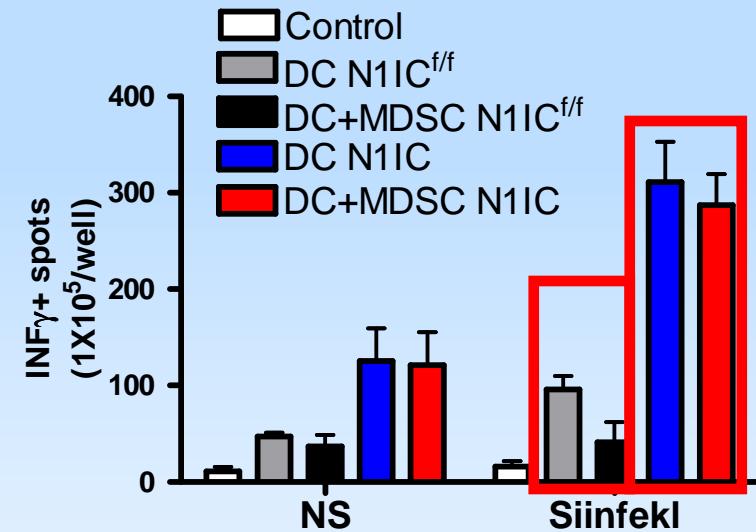

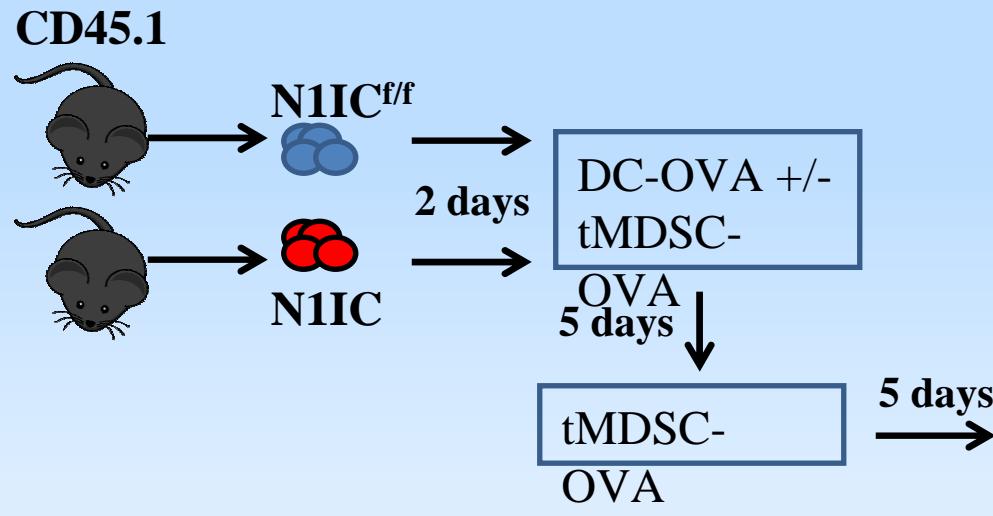

Transgenic N1IC increases anti-tumor effect of pre-activated antigen-specific CD8⁺ T cells

MDSC inhibited T cell-Notch 1-2 expression through a Nitric Oxide-dependent mechanism

Transgenic N1IC renders antigen-specific T cells resistant to MDSC

Conclusions

- Notch 1 and Notch 2 play a key role in CD8⁺ T cell function.
- Expression of N1IC increases anti-tumor capacity of CD8⁺ T cells, through endogenous promotion of effector mediators (Granzyme B and IFN γ).
- Rescue of Notch 1 signaling in CD8⁺ T cells increases adoptive cellular immunotherapy.
- N1IC CD8⁺ T cells are resistant to the suppressive effect of tumor-infiltrating MDSC.
