

A scientific regulatory perspective on cancer immunotherapy

- with specific focus on non-clinical development

Björn Carlsson, Associate professor Non-clinical Assessor, Medical Products Agency, Sweden Swedish Alternate in the Committee for Advanced Therapy, EMA

Disclaimer

The upcoming presentation is not necessary the view of the agency, but rather a personal reflection on issues which normally arise during assessment of cancer vaccines.

Established developmental programs

- Relevant models for proof-of-concept (transplanted patient tumors)
- Relevant species for toxicity
- Pathology for the target
- Clinical trials

Established CMC/specifications

- Purity
- Potency

approvais • authorisation • clinical thats • communication • competence • cosmitics • alalogue • directives • entropy • environment • evaluation • guidelines • harmonisation • health economics • hereopathics • information • inspection laboratory analysis • market surveillance • medicinal products • medical devices • narcotics • public health • quality • registration • regulations • reliability • risk/benefit • safety • scientific • standardisation • transparency • vigilance • approvals • anacotics • public health • quality • registration • regulations • reliability • risk/benefit • safety • scientific • standardisation • transparency • vigilance • approvals • authorisation • clinical trials • communication • competence • cosmetics • dialogue • directives • efficacy • environment • evaluation • approvals • authorisation • dinical trials • communication • competence • cosmetics • dialogue • directives • efficacy • environment • evaluation • approvals • authorisation • herbais • homeopathics • information • inspection laboratory • analysis • market surveillance • medicinal products • medical devices • public health

Developmental programs

- Relevant models for proof-of-concept. Not always. Homologous models?
- Relevant species for toxicity, most often monkey.
- Pathology for the target, not in terms of immune status of the tumor.
- Resistance and/or lack of efficacy? Tumor or immune system?
- Clinical trials.

CMC/Specification

- Purity
- Potency. At least in terms of binding to the target, but not in vivo immune activation

approvals * an onsation * on incar has * communication * completence * cosmics * analogue * anothers * entraces * entrace

Developmental programs

- Relevant models for proof-of-concept. Very seldom due to differences in amino acid sequence. Homologous models?
- Relevant species for toxicity, most often monkey. Increased immunity due to differences in amino acid sequence.
- Relevant for the adjuvant?
- Pathology for the target, not in terms of immune status of the tumor.
- Resistance and lack of efficacy? Tumor or immune system?

CMC/Specification

- Purity
- Potency?

On the issue of purity/potency and clinical effect

- Differences between in vitro assays and the tumor environment.
 - "Immune pathology" of the tumor and immune status of the patient vs product. Largely unknown today.
 - Cell lines vs cultures of patient tumor vs in vivo patient tumor.
 - Reactive T cells will proliferate, i.e. sub-detectable levels might also generate clinical benefit.

In vivo models

- Tumors go to great lengths to evade the immune response
- Systematic studies have identified multiple mechanisms cancers employ to defeat the immune response
 - Immunosuppressive cytokines: TGF-β, IL-4, -6, -10
 - Immunosuppressive immune cells: T-regs, macrophage
 - Disruption of immune activation signaling: loss of MHC receptor, IDO production
- Goal: therapy strategies that "liberate" underlying anticancer immune responses
- Immune checkpoints not even in the picture in 2008!

In vivo models

- Induce immune reaction against vaccine, but not the tumor
- Immune system mainly recognizes "neo-antigens" from "passenger" mutations rather than shared antigens
 - Antigens different for each tumor
 - Vaccine must involve autologous tumor cells
- Most immune-responsive tumors "autovaccinate", but immune regulation prevents an effective response
- Even if vaccine enhances antitumor immunity, cells likely to be suppressed in the tumor microenvironment

In vivo models - shortcomings

Tumour models using transplanted cell lines

Advantages

- Rapid and reliable tumour growth means treatment efficacy/altered tumour growth in different mouse strains easily determined
- Models for various cancer types available e.g. prostate, melanoma, breast cancer.
- Behaviour of cell lines able to be altered by modification of gene expression

Disadvantages

- Weaker model of natural tumour microenvironment (maybe improved by injection into orthotopic site)
- Injection and death of tumour cells may induce inflammation, altering tumour immune response
- Rapid tumour growth may prevent normal tumour: immune interaction to develop

Subcutaneous injection

Cell lines injected under the skin
Tumour growth easily monitored

Intravenous injection • Experimental model of lung metastasis

Orthotopic injection

- Injection of tumour cell line into organ of tumour origin (e.g. Renca injection into kidney)
- More faithful recreation of turnour microenvironment.

Spontaneous tumour models

Advantages

- Heterogeneous tumour development more faithfully recapitulates human tumour development
- Tumour immune response, and immune escape may recapitulate clinical observations

Disadvantages

- Longer time required and higher cost compared to transplanted tumour models
- Tumour heterogeneity increases complexity of treatment, results can be more difficult to interpret

Example of carcinogen induced cancer • MCA induced fibrosarcoma

- DMBA/TPA induced skin papillomas
- DSS+AOM induced colon cancer

Genetically engineered tumour mouse models • Strains of mice with systemic or organ specific expression of oncogenes which develop spontaneous tumours, generally between 3-12 months of age

In vivo models -Shortcomings

 Species differences in immunology will be the same regardless of model.

	MOUSE	HUMAN
Altered peripheral blood cell make up eg:		
Lymphocytes	~80%	~40%
Neutrophils	~20%	~60%
CDI genes	One (CDId)	Multiple (CD1a-e)
CD2-ligand interaction:		
T cell dependence	Low	High
Ligand	CD48	CD58 (LFA-3)
Affinity	Low	High
CD4 on macrophages	Absent	Present
EC present Ag to CD4+ T cells	No	Yes
CD5 and CD23 on B cells	Mutually exclusive expression	Co-expression
CD8 on DC	Present	Absent
CD28 expression on L cells	By 100% of CD4* and CD8* I cells	By 80% of CD4* and 50% of CD8* I cells
CD33 expression	Granulocytes	High on CC B calls and alarma calls
CD36 expression on B cells	Low on GC B cells, absent in plasma cells	Proprient
CD40 on EC	Pupeling system de graft europhiel	Pursing does not extend amft supplied
CD45 expressing cens	Abcont	Purging does not extend grait survival
CD52 expression	Absent	Present
L-10	Th2 outokine	Thi and Th? outokine
P-Selectin expression	In-regulated by inflammatory mediators	Interpropries to inflammatory mediatory
TI 82 expression on PBI	Low (induced on many cells including T cells)	Constitutive (but not on T cells)
TLR3	Induced by LPS	Not induced by LPS
TLR IO	Pseudogene	Highly expressed in lymphoid tissues
Hemotopolesis in spleen	Continues into adulthood	Terminates prenatal
Hemotopoletic stem cells	c-kithigh	c-ktlow
Presence of Bronchus-associated	Present	Absent in healthy tissue
Lymphold Tissue (BALT)		
Leukocyte defensins	Absent	Present on neutrophils
fMLP receptor affinity	Low	High
Fc RI	Absent	Present
Fe RIIA, C	Absent	Present
IL-13 effect on B cells	None	Induces switch to IgE
Iny Lexpression	Inymocytes, peripheral I cells	Absent from all 1 cells, yet expressed by neurone
Caspase 10	Absent	Present
Theypression of I -10	Tb2	Th Land Th?
GIVCAM	Present	Absent
MHC II expression on T cells	Absent	Present
KyL3 K channel on T cells	Absent	Present
MUCI on T cells	Absent	Present
Granulysin	Absent	Present
Chemokine receptor CXCR1	Absent	Present
Chemokines:		
CXCL8		
CXCLII		
CCLI3		
CCLI4	All absent	All present
CCLIS		
CCLI8		
CCL23 CCL24/CCL24		
CC16 D		
CCI9		
CCL12	All present	All absent
CXCLI5		
MRP-1/2, lungkine, MCP-5	Present	Absent
Passenger leukocytes	Account for graft immunogenicity	Do not account for graft Immunogenicity

Ag = antigen, DC = dendritic cell, EC = endothelial cell, GC = germinal centre, LPS = Itpopolysaccharide, N = neutrophil, P8L = pentpheral blood leukocytes, Th = T helper cell, TLR = Tol-like receptor

In vivo models – conclusions

• In vivo models which generate clinically relevant data are in many ways missing in comparison to models used for small molecules.

Ways forward;

- Acknowledge the shortcomings and continue to develop vaccines which have a high probability of failing during clinical testing.
 - Such studies should be kept short and uncomplicated due to irrelevance.
- Start using models which mimic the human disease more closely in regard to the tumor-immune system interactions.
- Extension of In vitro analysis.
- Extend the clinical data in regard to "immune pathology" and efficacy (or lack thereof).
 - Time aspects?

Developers should, given the bureaucracy, cost and time associated with conducting clinical trials, utilizing preclinical mouse models that can more accurately model tumor immunity and allow more informed assessment of intended therapies.

General guidance

- General advice is given in section 6.3.2 in the EMA/ CHMP/205/95/Rev.4 guide line
- Starting dose should be justified by non-clinical in vitro or in vivo data, also using the MABEL (Minimum Anticipated Biological Effect Level) approach
- Dose selection should be based on immune response monitoring during early clinical development.
- Clinical responses may need time to develop, i.e. progression before clinical effect
- Tumor biopsies are vital to assesse immune activation
- Autoimmune reactivity and induction of tolerance should be monitored
- High tumor burden too high hurdle, vaccination in an adjuvant setting?
- Target antigen expression , patient selection.

Interaction with the Agency throughout development

- Highly recommended for complex products
- Available via;
 - Scientific advice
 - Central, EMA, advice
 - National, NCA
 - Classification, ATMPs only
 - Certification, ATMPs only
 - Homepages
 - Innovation office
 - Clinical trial application
 - Voluntary Harmonization Procedure (VHP)
 - National Agency

Scientific advice

- EMA
 - Written procedure, with possibility of face-to-face
 - High cost with fee-reductions
 - Non-valid for clinical trials
- NCA
- Different between EU countries
- Face-to-Face
- Low cost in comparison to EMA advice
- The same assessors as for EMA advice
- Valid for clinical trials

approvals • authorisation • clinical trials • communication • competence • cosmitics • dialogue • directives • efficacy • environment • evaluation • guidelines • harmonisation • health economics • herbals • homeopathics • information • inspection laboratory analysis • market surveillance • medicinal products • medical devices • narcotics • public health • quality • registration • regulations • reliability • risk/benefit • safety • scientific • standardisation • transparency • vigilance • approvals • authorisation • clinical trials • communication • competence • cosmetics • dialogue • directives • efficacy • environment • evaluation • approvals • authorisation • clinical trials • communication • competence • cosmetics • dialogue • directives • efficacy • environment • evaluation • approvals • authorisation • linical trials • communication • competence • cosmetics • dialogue • directives • efficacy • environment • evaluation • approvals • authorisation • herbals • homeopathics • information • inspection laboratory analysis • market surveillance • medicinal products • medical devices • public health

Scientific advice

- Can cover all aspects of development
- Normally 4 to 10 questions in total
- Questions, IB, IMPD and Clinical protocol submitted 2-4 weeks before the meeting
 - Questions should include "applicants position"
 - No pre-assessment of data
 - Quality of the question = Quality of the answer
