# Immunotherapy for the Treatment of Skin Cancers

Hussein Tawbi, MD, PhD

Professor, Director of Melanoma Clinical Research

The University of Texas MD Anderson Cancer Center

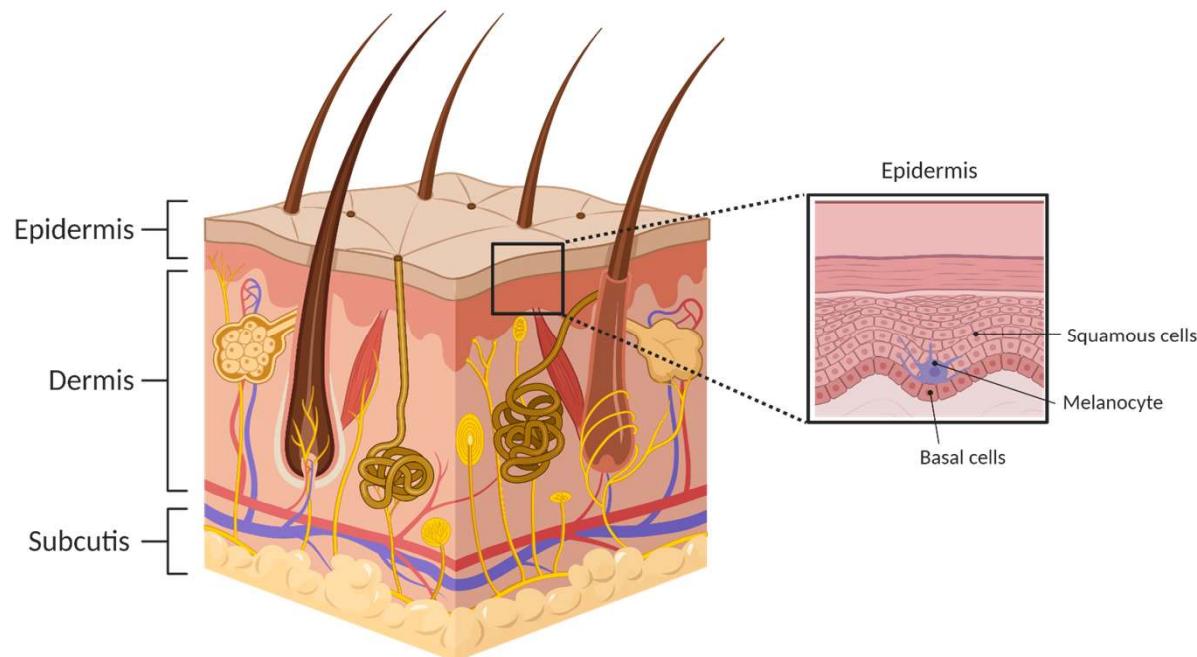

# Disclosures

- Consulting Fees: Genentech, BMS, Novartis, Merck, Array
- Contracted Research: Genentech, BMS, Novartis, Merck, GSK
- I will be discussing non-FDA approved indications during my presentation.

# Background

- Skin cancer is the most common type of cancer
- Three most common types of skin cancers:
  - Basal cell carcinoma
  - Squamous cell carcinoma
  - Melanoma
- Melanoma was one of the tumor types for which immunotherapy was tested and provided proof of concept

# Outline

- Melanoma
  - Front-line treatment
  - Second-line or later
  - Adjuvant and neoadjuvant settings
- Merkel cell carcinoma
- Squamous cell carcinoma
- Future areas of research

#LearnACI

# Immunotherapy treatment options for metastatic melanoma

| Treatment                                | Indication   | Dose  |
|--|--|---|
| Ipilimumab                               | Unresectable/Metastatic melanoma: newly diagnosed or after progression, all patients $\geq$ 12 yr              | 3 mg/kg Q3W for 4 doses   |
| Pembrolizumab                            | Unresectable/metastatic melanoma   | 200 mg Q3W or 400 mg Q6W  |
| Nivolumab                                | Unresectable/metastatic melanoma   | 240 mg Q2W or 480 mg Q4W  |
| Nivolumab + ipilimumab                   | Unresectable/metastatic melanoma   | 1 mg/kg nivo followed by 3 mg/kg ipi Q3W, Maintenance: nivolumab 240 mg Q2W or 480 mg Q4W   |
| Atezolizumab + cobimetinib + vemurafenib | BRAF V600 mutation-positive unresectable/metastatic melanoma   | 28-day cycle of cobi/vem, then atezolizumab 840 mg every 2 weeks with cobimetinib 60 mg orally once daily (21 days on/7 days off) and vemurafenib 720 mg orally twice daily |
| Talimogene laherparepvec (T-Vec)         | Local treatment of unresectable cutaneous, subcutaneous, and nodal lesions in recurrent melanoma after surgery | Intralesional injection: $\leq$ 4 mL at $10^6$ PFU/mL starting; $10^8$ PFU/mL subsequent  |

# Trials leading to initial approvals

| Trial         | Treatment arms     | n   | Patient selection criteria              | ORR          | Median OS (months) | Median PFS (months) |
|---------------|--------------------|-----|---|--------------|--------------------|---------------------|
| NCT00094653   | Ipilimumab + gp100 | 403 | Pretreated advanced melanoma            | 5.7%         | 10.0               | 2.76                |
|               | Ipilimumab         | 137 |   | 10.9%        | 10.1               | 2.86                |
|               | Gp100              | 136 |   | 1.5%         | 6.4                | 2.76                |
| KEYNOTE-006   | Pembrolizumab      | 368 | Advanced melanoma, ≤1 prior treatment   | 33.7%, 32.9% | 32.7               | 8.4                 |
|               | Ipilimumab         | 181 |   | 11.9%        | 15.9               | 3.4                 |
| CheckMate 037 | Nivolumab          | 272 | Melanoma with progression on ipilimumab | 27%          | 16                 | 3.1                 |
|               | Chemotherapy       | 133 |   | 10%          | 14                 | 3.7                 |
| OPTiM         | T-VEC              | 295 | Unresectable stage IIIB-IV melanoma     | 26.4%        | 23.3               | TTF: 8.2            |
|               | GM-CSF             | 141 |   | 5.7%         | 18.9               | TTF: 2.9            |

# Trials in front-line melanoma

| Trial         | Treatment arm(s)                         | N   | Patient selection criteria                                      | ORR   | Median PFS (months) | Landmark OS rate | Grade 3+ adverse events (%) |
|---------------|--|-----|---|-------|---------------------|------------------|-----------------------------|
| KEYNOTE-001   | Pembrolizumab                            | 655 | Front-line  | 52%   | 16.9                | 5-year: 41%      | 17%                         |
|               |  |     | ITT   | 41%   | 8.3                 | 5-year: 34%      |                             |
| CheckMate 067 | Nivolumab + ipilimumab                   | 314 | Untreated stage III or IV melanoma                              | 58%   | 11.5                | 5-year: 52%      | 59%                         |
|               | Nivolumab                                | 316 |   | 45%   | 6.9                 | 5-year: 44%      | 23%                         |
|               | Ipilimumab                               | 315 |   | 19%   | 2.9                 | 5-year: 26%      | 28%                         |
| CheckMate 066 | Nivolumab                                | 210 | Untreated BRAF WT advanced melanoma                             | 42.9% | 5.1                 | 3-year: 51.2%    | 15%                         |
|               | Dacarbazine                              | 208 |   | 14.4% | 2.2                 | 3-year: 21.6%    | 17.6%                       |
| IMspire150    | Atezolizumab + cobimetinib + vemurafenib | 256 | <i>BRAF</i> V600 mutation-positive advanced/metastatic melanoma | 66.3% | 15.1                | 2-year: 60%      | 79%                         |
|               | Cobimetinib + vemurafenib                | 258 |   | 65.0% | 10.6                | 2-year: 53%      | 73%                         |

#LearnACI

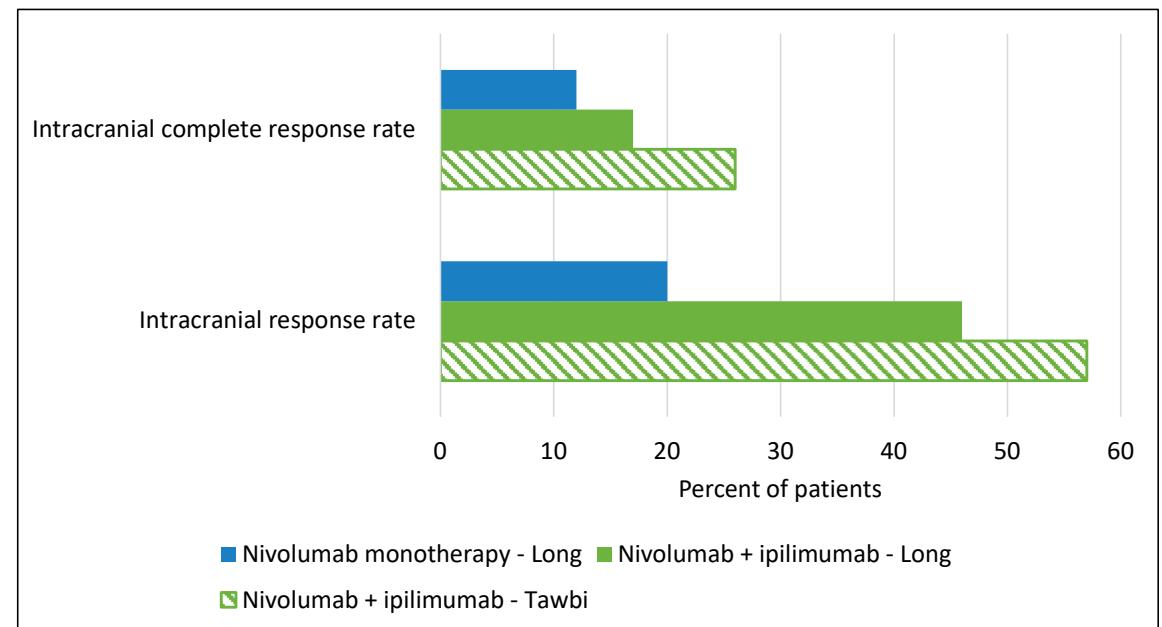

# Choosing appropriate regimens

- Consider combination ipilimumab/nivolumab up-front for patients with:
  - Brain metastases
  - Mucosal melanoma
  - High disease burden

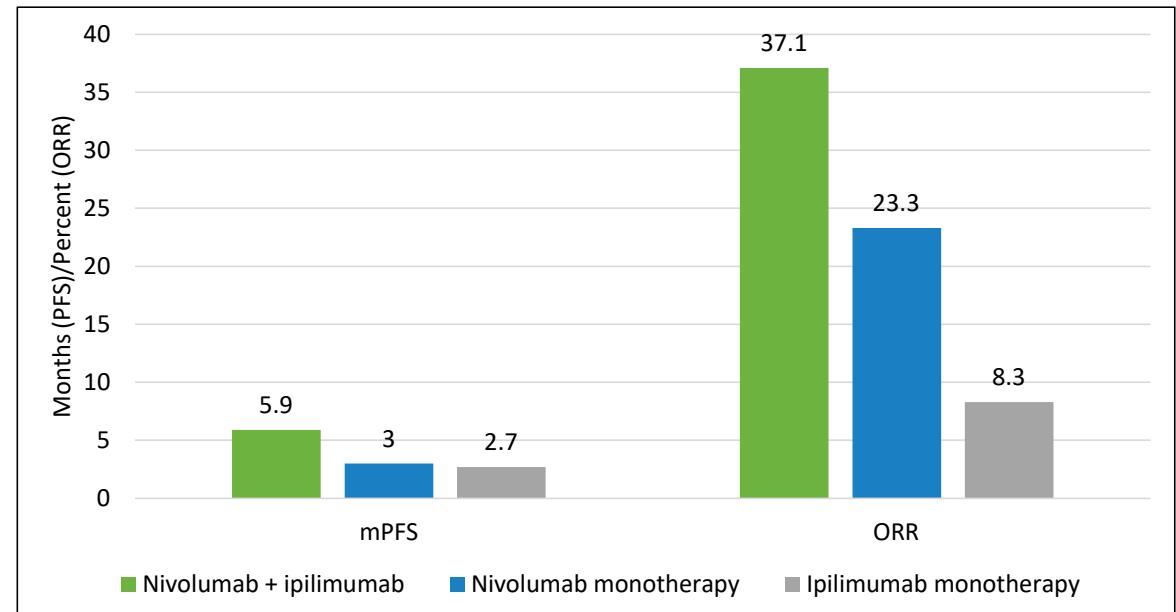

# Choosing appropriate regimens

- Consider combination ipilimumab/nivolumab up-front for patients with:
  - Brain metastases
  - Mucosal melanoma
  - High disease burden

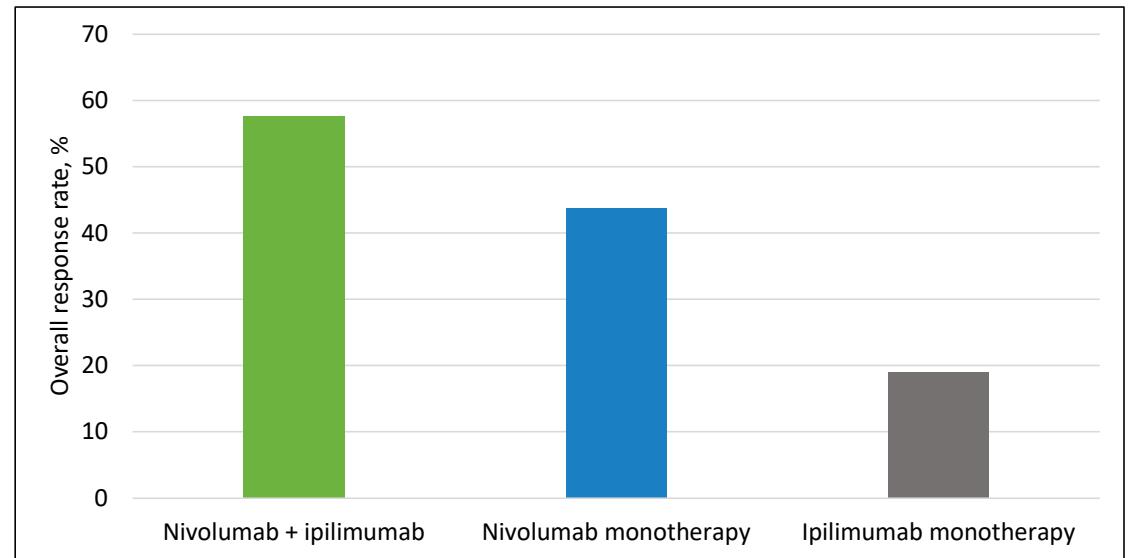

# Choosing appropriate regimens

- Consider combination ipilimumab/nivolumab up-front for patients with:
  - Brain metastases
  - Mucosal melanoma
  - High disease burden

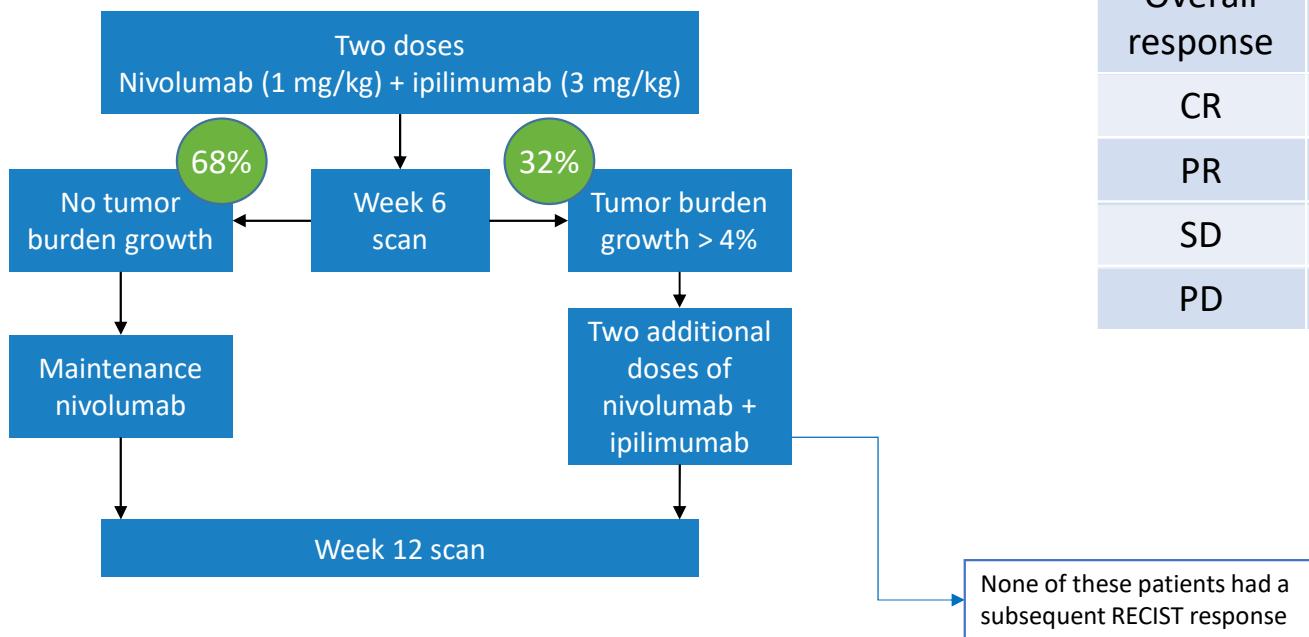

# Choosing appropriate regimens

- Consider combination ipilimumab/nivolumab up-front for patients with:
  - Brain metastases
  - Mucosal melanoma
  - High disease burden

# Question: How many combination doses to give

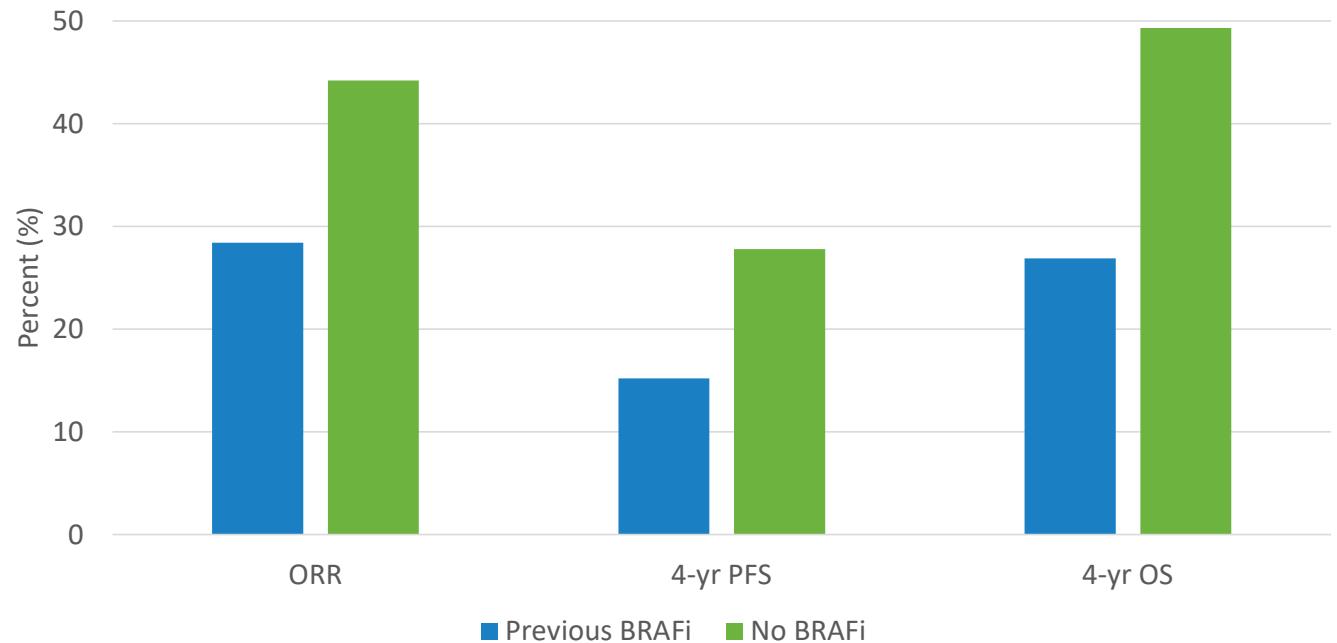

| N=60             | Week 6 | Week 12 | Best overall response rate |
|------------------|--------|---------|----------------------------|
| Overall response | 35%    | 48%     | 57%                        |
| CR               | 0      | 5%      | 18%                        |
| PR               | 35%    | 43%     | 38%                        |
| SD               | 43%    | 18%     | 22%                        |
| PD               | 22%    | 30%     | 22%                        |

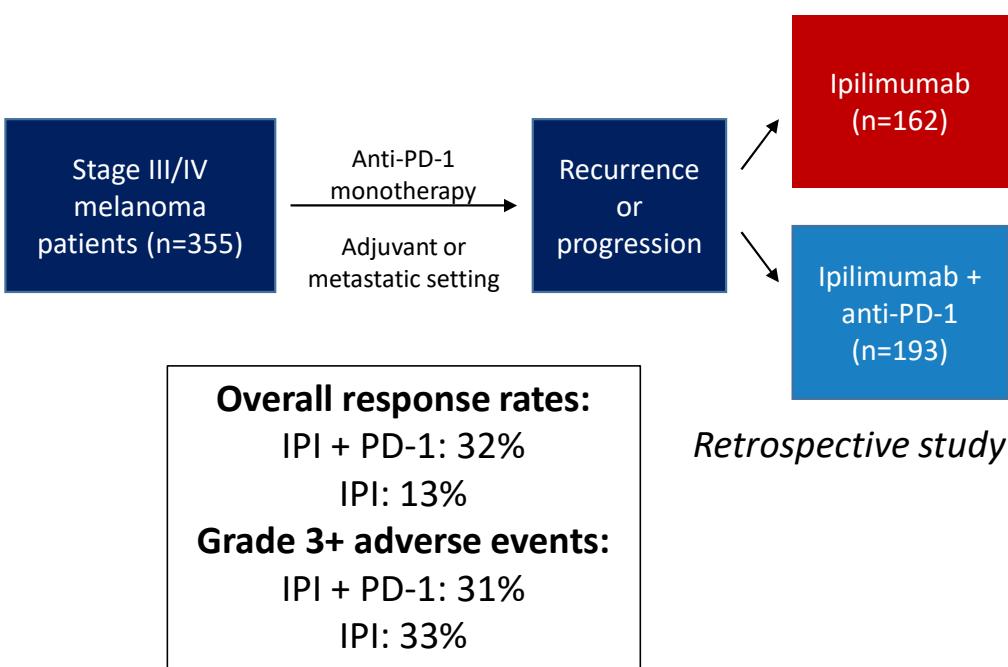

## Adverse events

- 100% of patients had any-grade irAEs, regardless of how many doses received
- 57% had grade 3-4 irAEs

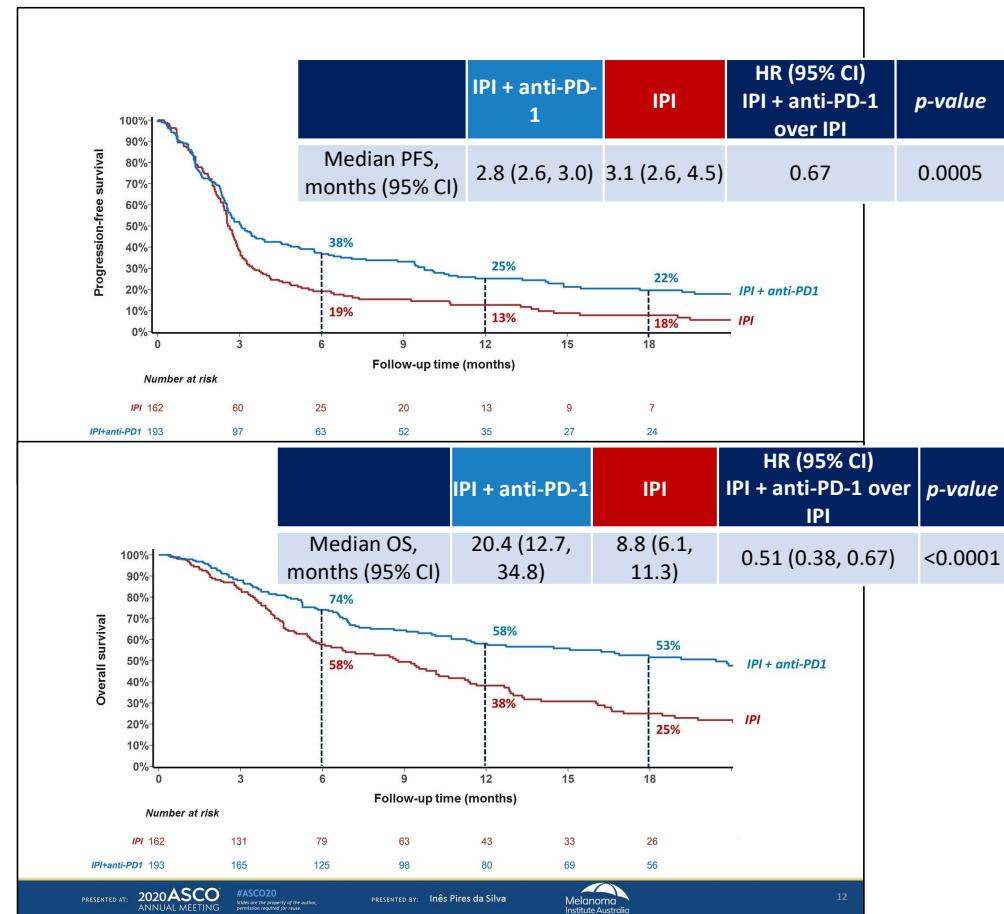

# Question: Does the sequence of targeted therapy and immunotherapy impact response?

Retrospective data suggests that patients who received BRAF inhibitors prior to treatment with pembrolizumab tended to have poorer outcomes on pembrolizumab therapy than those patients without prior BRAF inhibitor exposure.

# Question: what to do after PD-1 progression

# Adjuvant treatment options for melanoma

| Drug                                 | Indication   | Dose  |
|--------------------------------------|--|---|
| Dabrafenib + trametinib <sup>+</sup> | Adjuvant BRAF+ melanoma with lymph node involvement following complete resection | Dabrafenib 150 mg twice daily + trametinib 2 mg daily   |
| High-dose interferon alfa-2b*        | Adjuvant – high risk for systemic recurrence                                     | Induction: 20m IU/m <sup>2</sup> IV 5x/wk for 4 wks<br>Maintenance: 10m IU/m <sup>2</sup> s.c. 3x/wk for 48 wks |
| Ipilimumab*                          | Adjuvant therapy in stage III melanoma after complete resection                  | 10 mg/kg Q3W for 4 doses, then 10 mg/kg Q12W for 3 years  |
| Pembrolizumab                        | Adjuvant therapy of melanoma following complete resection – 1 year               | 200 mg Q3W or 400 mg Q6W  |
| Nivolumab                            | Adjuvant treatment of melanoma after complete resection – 1 year                 | 240 mg Q2W or 480 mg Q4W  |

<sup>+</sup>Not an immunotherapy; for reference

\*not commonly used in this setting; historical reference

**IIIC**

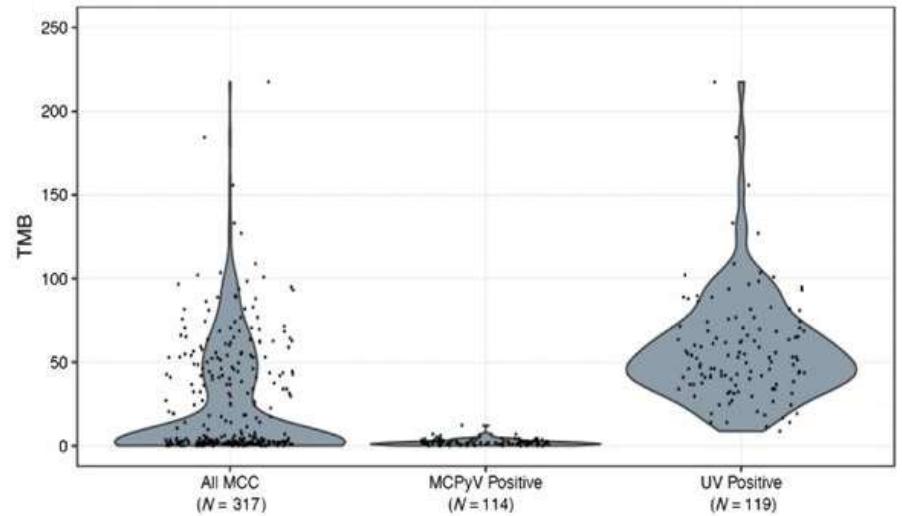

# Outline

- Melanoma
  - Front-line treatment
  - Second-line or later
  - Adjuvant and neoadjuvant settings
- Merkel cell carcinoma
- Squamous cell carcinoma
- Future areas of research

# Merkel cell carcinoma

- Associated with Merkel cell polyomavirus infection
- Higher incidence with weakened immune system (HIV, immunosuppressives) and increased age
- Distinct genomic profiles for UV- and virus-driven carcinomas
- Median PFS with chemo: ~90 days

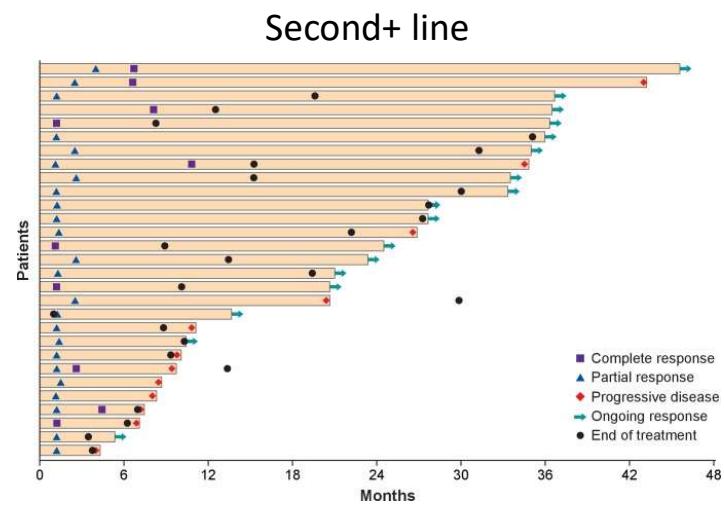

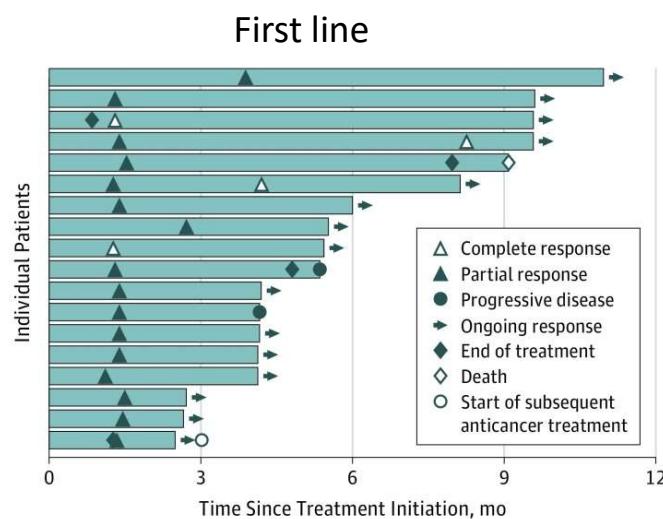

# Approved checkpoint inhibitors in Merkel cell carcinoma

| Drug          | Indication   | Dose  |
|---------------|--|---|
| Avelumab*     | Patients >12 yr with metastatic<br><b>Merkel cell carcinoma</b>                        | 800 mg Q2W + premedication<br>(first 4 cycles)                                  |
| Pembrolizumab | Adult/pediatric with recurrent<br>advanced/metastatic <b>Merkel<br/>cell carcinoma</b> | Adults: 200 mg Q3W or 400<br>mg Q6W<br>Pediatric: 2 mg/kg (up to 200<br>mg) Q3W |

\*Requires premedication with an antihistamine and acetaminophen prior to first four infusions

# Avelumab in Merkel cell carcinoma

| Setting      | N  | ORR   | Median PFS | Median OS   |
|--------------|----|-------|------------|-------------|
| First line   | 39 | 62.1% | 9.1 months |             |
| Second+ line | 88 | 33.0% |            | 12.6 months |

# Outline

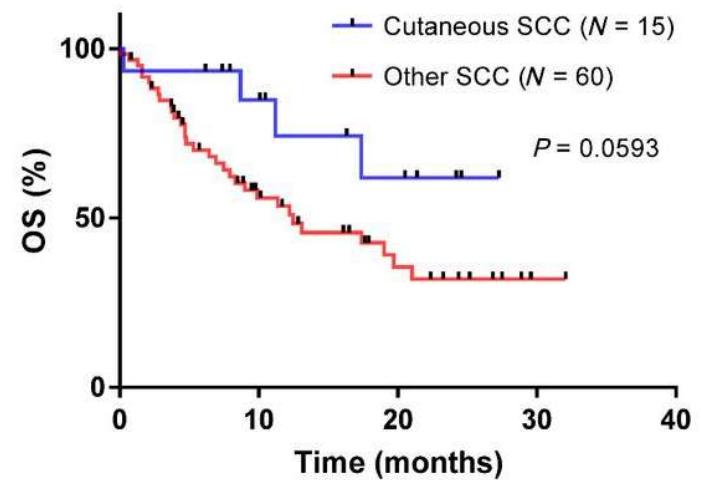

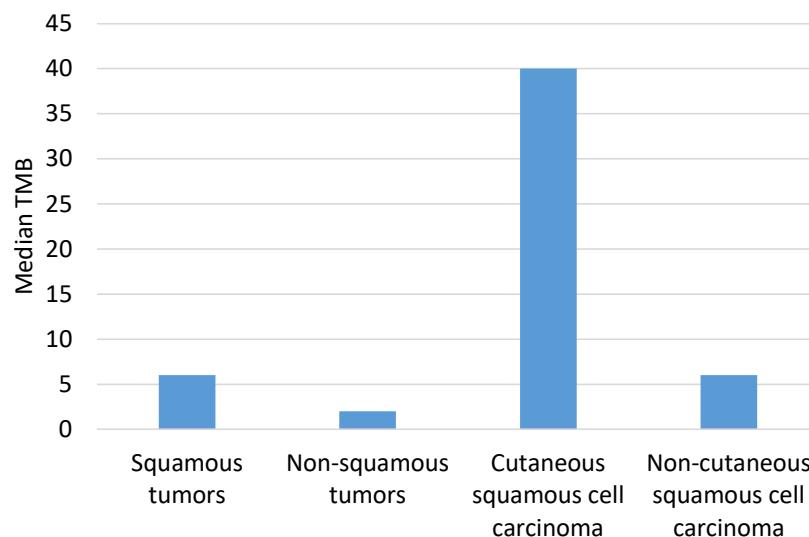

- Melanoma
  - Front-line treatment
  - Second-line or later
  - Adjuvant and neoadjuvant settings
- Merkel cell carcinoma
- Squamous cell carcinoma
- Future areas of research

# In development: Combination IO with BRAF targeted therapy

## KEYNOTE-022 Part 3 Study Design (NCT02130466)

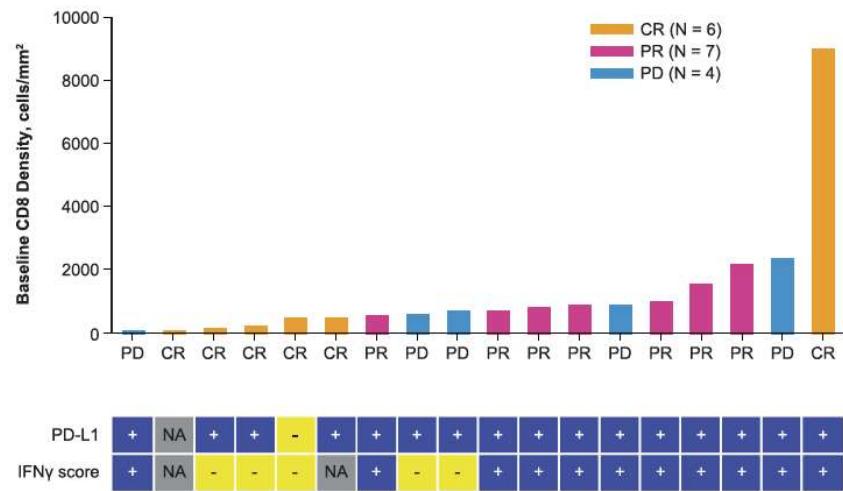

- Primary end point: PFS
- Secondary end points: ORR, duration of response, and OS
- Data cutoff: Feb 15, 2018

<sup>a</sup>Owing to the small number of patients enrolled in the ECOG PS 1 and LDH  $\leq 1.1 \times \text{ULN}$  strata, these strata were combined.

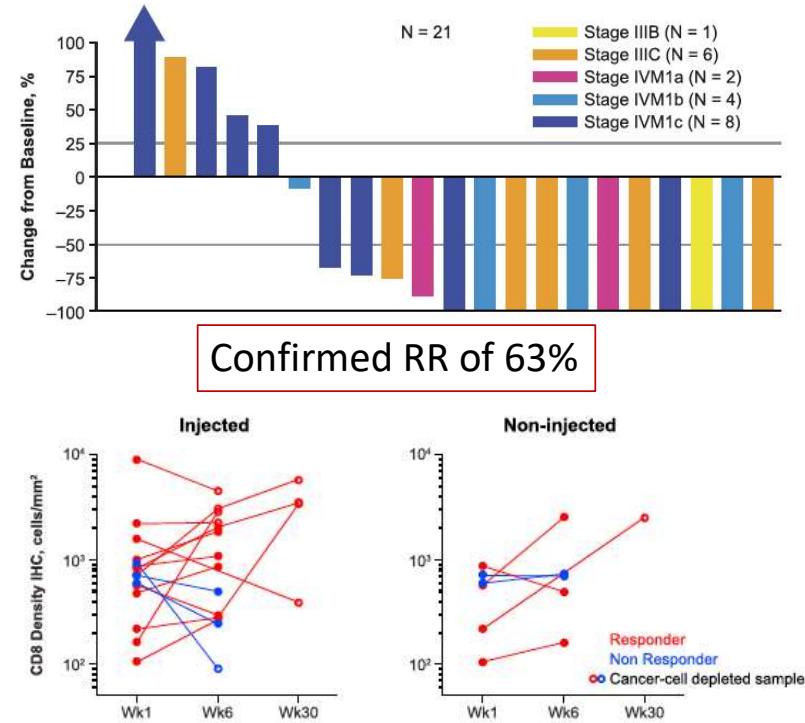

Multiple other triplet regimens are being tested.

# In development: Combination IO with oncolytic virus

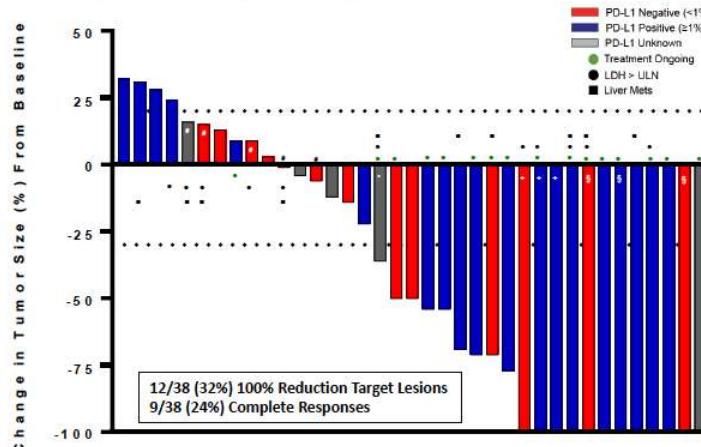

Phase I: Pembrolizumab + TVEC

# In development: Combination IO with pegylated IL-2 (NKTR-214)

Efficacy (response rate)  
 data from non-randomized cohorts of urothelial bladder cancer, renal cell carcinoma, and melanoma looks promising

## Stage IV IO-Naïve 1L Melanoma Cohort at RP2D Best Overall Response by Independent Radiology

| 1L Melanoma (n=38 Efficacy Evaluable) | Overall Response Rate |
|---------------------------------------|-----------------------|
| Confirmed ORR (CR+PR)                 | 20 (53%)              |
| CR                                    | 9 (24%)               |
| DCR (CR+PR+SD)                        | 29 (76%)              |
| PD-L1 negative (n=14)                 | 6 (43%)               |
| PD-L1 positive (n=19)                 | 13 (68%)              |
| PD-L1 unknown (n=5)                   | 1 (20%)               |
| LDH > ULN (n=11)                      | 5 (45%)               |
| Liver metastases (n=10)               | 5 (50%)               |

High level of concordance in ORR between independent central radiology (53%) and investigator-assessed 19/38 (50%).

# Conclusions

- Melanoma was one of the foundational disease states for testing immunotherapies
- Avelumab and pembrolizumab are now approved for Merkel cell carcinoma, and cemiplimab and pembrolizumab are approved for cutaneous squamous cell carcinoma
- Combination immunotherapies may lead to higher response rates and more durable responses
