- Research support; MacroGenics Inc,. Rockville, MD
- Research support; Kura Oncology, San Diego, CA

Background – I

- Chemotherapy remains the standard of care for most patients with AML, in spite of recent approvals of novel drugs
- We recently identified immune subgroups of AML ('immune-infiltrated' and 'immune-depleted') that predict chemotherapy resistance but also response to flotetuzumab immunotherapy (#O460 at ASH 2019)
 - The genetic drivers of immune infiltration in AML are presently unknown
- TP53 mutations occur in 8-10% of *de novo* AML cases and are associated with chemotherapy resistance, high risk of relapse and dismal prognosis even after HSCT
- The functional consequences of *TP53* mutation/inactivation on host immune regulation have been largely overlooked in AML
 - The *TP53* mutants studied thus far in AML do not show any evidence of GOF mechanisms (Boettcher S, et al. *Science* 2019)

Background – II

- *TP53* suppresses inflammatory responses in mice (Komarova EA, et al. *FASEB J.* 2005)
- *TP53* inactivation in T cells enhances differentiation to Th17 cells and promotes spontaneous autoimmunity in mice (Zhang S, et al. *FASEB J.* 2011)
- TP53 mutations are enriched in the immune favorable phenotype of breast cancer (ICR4 or Th1-dominant [PD-L1⁺, PD-1⁺, IDO1⁺]) (Hendrickx W, et al. Oncoimmunology 2017)
- *TP53* mutational status predicts clinical benefit of PD-1 blockade in lung adenocarcinoma (Dong ZY, et al. *Clin. Cancer Res.* 2017)
 - TP53-mutated cases show higher TMB and increased expression of T cell-effector genes and IFN-γ–related genes

34th Annual Meeting & Pre-Conference Programs

Conclusions

- TP53-mutated cases (TCGA-AML and Beat-AML) show higher levels of T-cell infiltration, immune checkpoints and IFN-γ signaling compared with AML subgroups with other risk-defining molecular lesions
- *TP53*-mutated primary AML BMs are enriched in IL-17, TNF and IFN signaling molecules and show higher levels of T-cell infiltration and immune checkpoints relative to *TP53*-wt primary AML BMs
- Whether *TP53*-mutated AML can be amenable to respond to Tcell targeting immunotherapies remains to be determined
