Disclosures

- Miltenyi Biotec, Contracted Research
- I *will* be discussing non-FDA approved indications during my presentation.

ADVANCES IN Cancer IMMUNOTHERAPY™

Why does the immune system fail to eliminate cancer?

Cancer cells grow progressively in immunocompetent hosts without evidence of T cell exhaustion or systemic anergy.

ADVANCES IN Cancer IMMUNOTHERAPY™

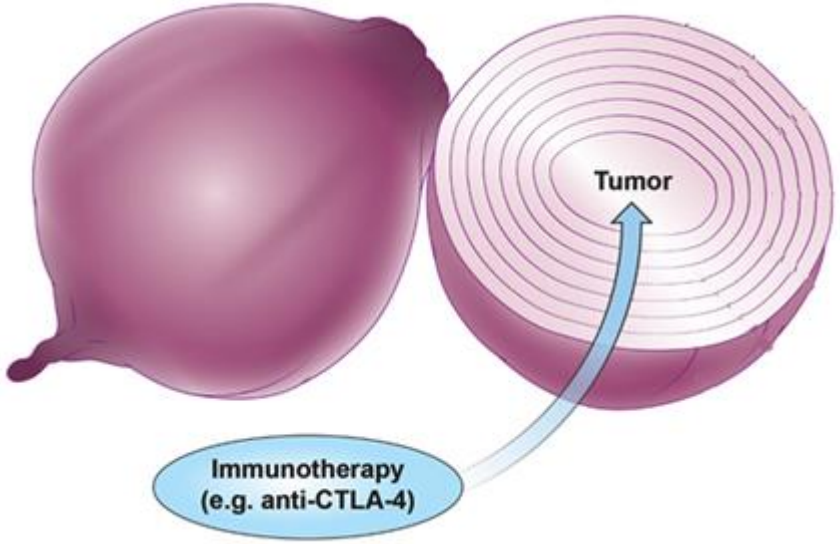
To exist, tumors must evolve mechanisms to locally disable and/or evade the immune system.

The goal of immunotherapy, then, is to restore the capacity of the immune system to recognize and reject cancer.

ADVANCES IN Cancer IMMUNOTHERAPY™

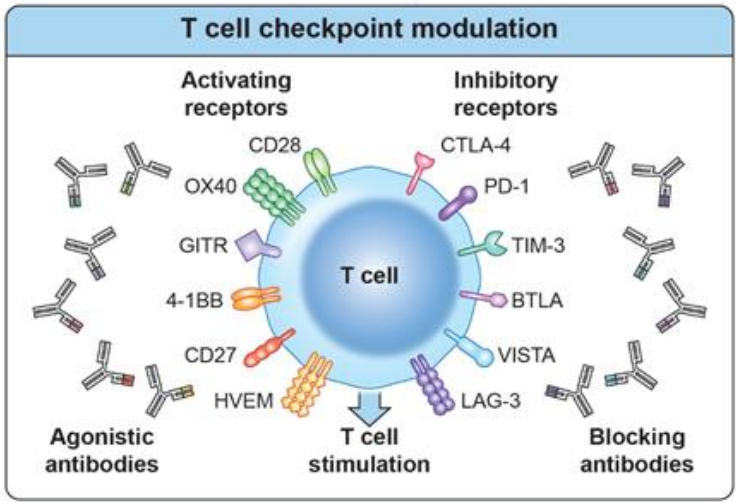
Multi-layered immunosuppression

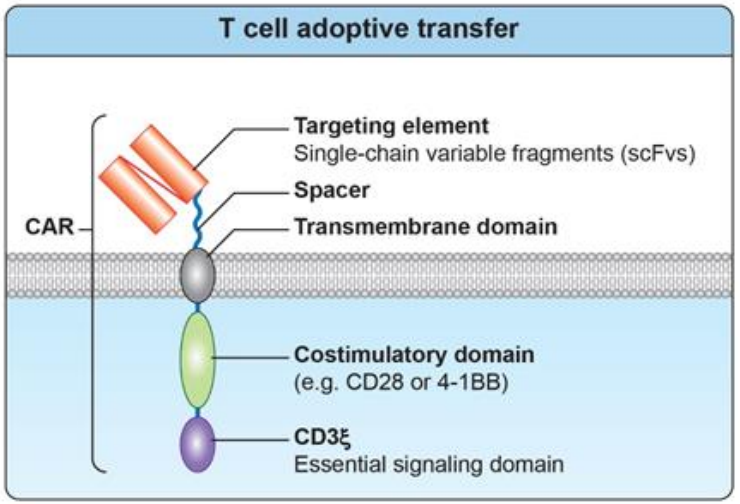
- Tumors insulate themselves with dense layers of immunosuppressive stroma
- Overcoming the many layers of interconnected and often functionally redundant immune suppressive mechanisms represents a daunting challenge for tumor-specific T cells
- Immunotherapy can “peel back” the layers of local immune suppression, thereby restoring the capacity of T cells to eradicate the tumor

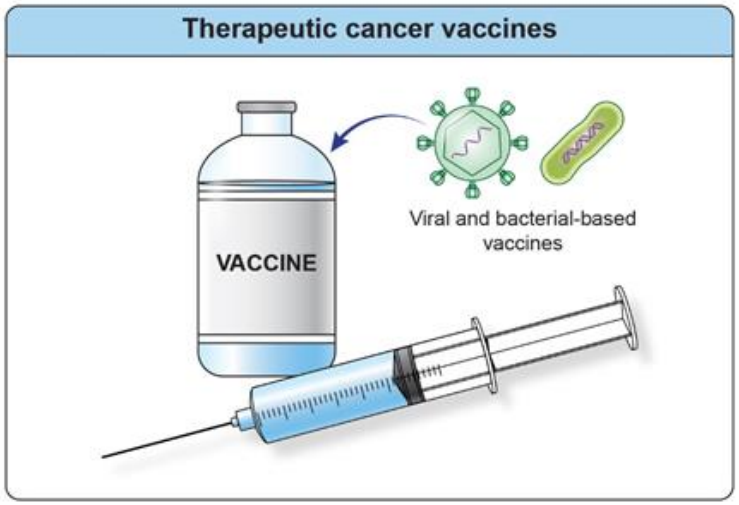


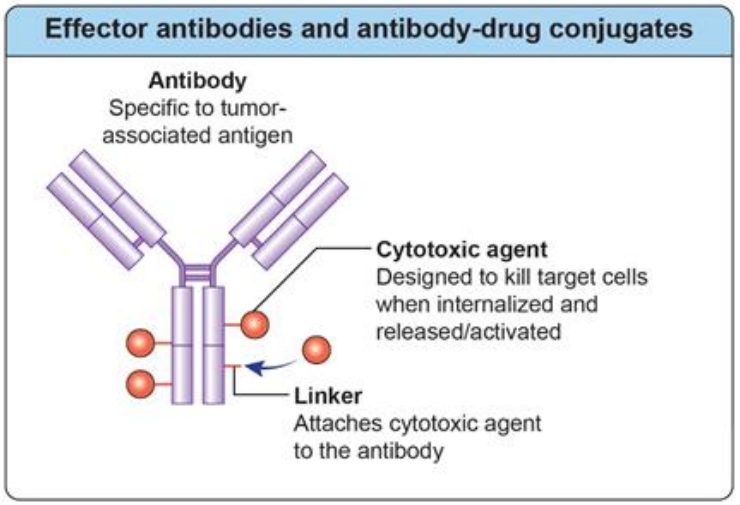
ADVANCES IN Cancer IMMUNOTHERAPY™

Types of immunotherapy



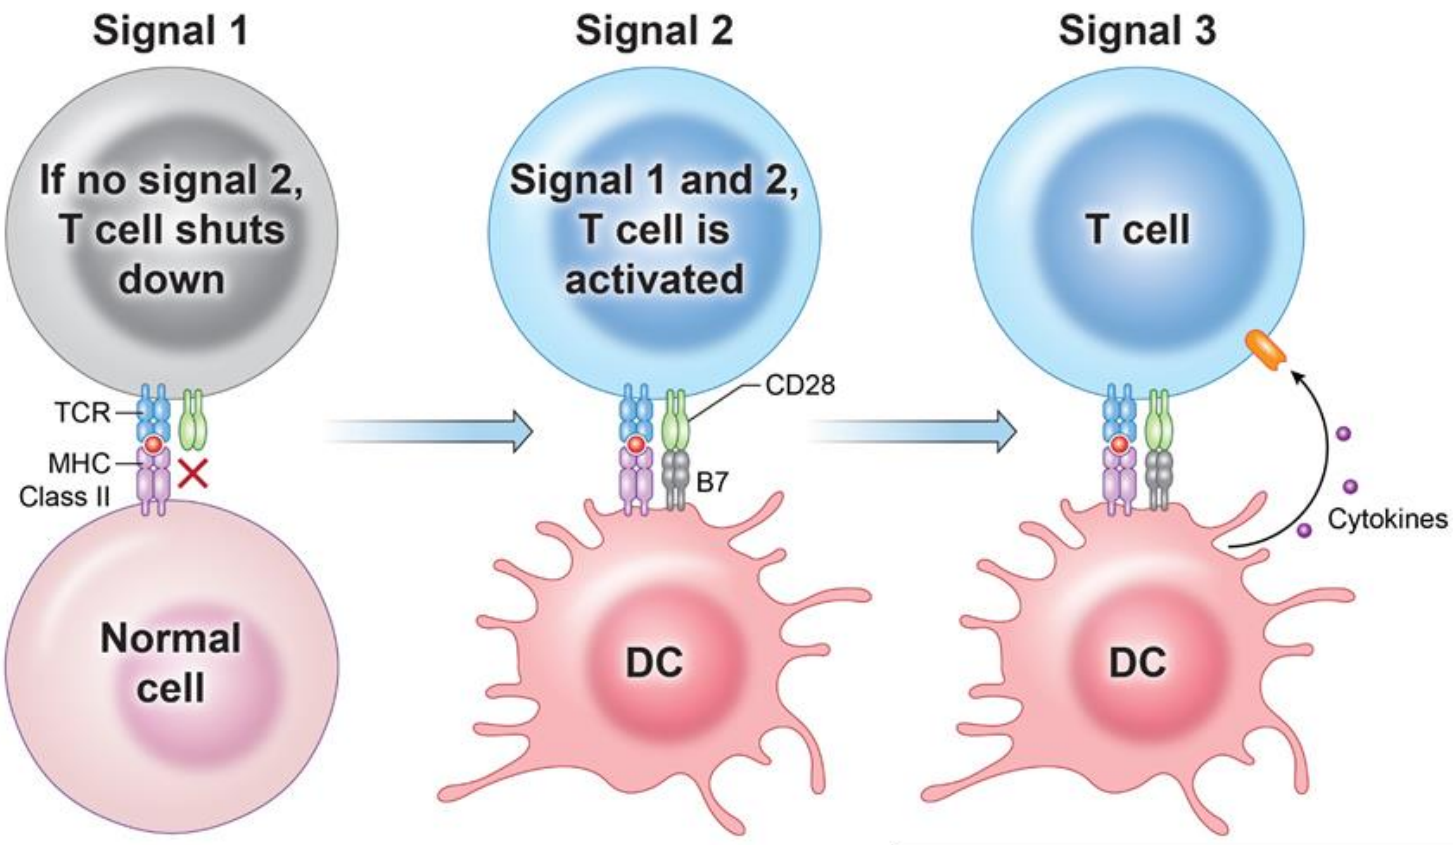






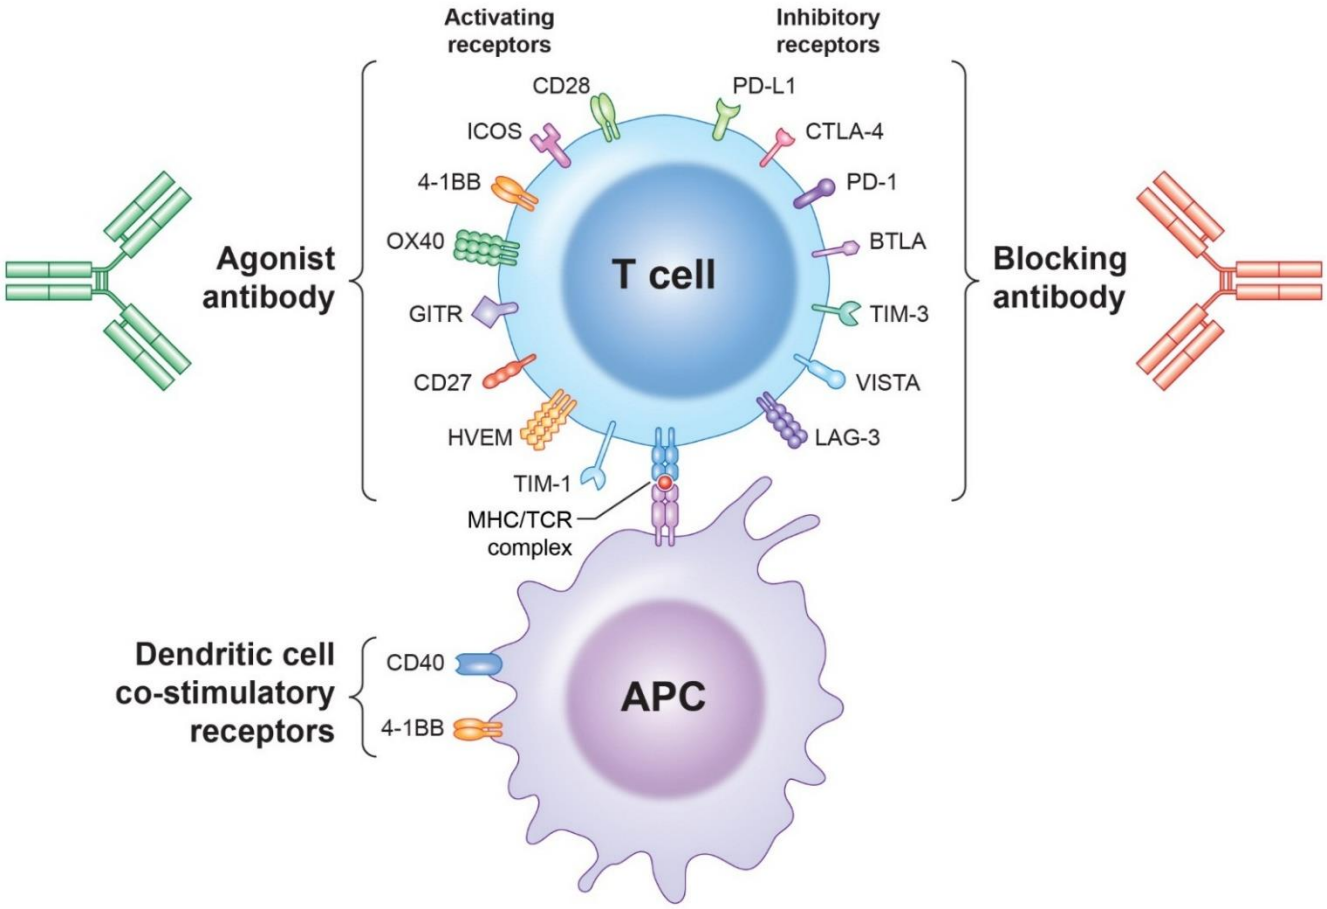
ADVANCES IN Cancer IMMUNOTHERAPY™

Three signals for antigen-specific T cell activation



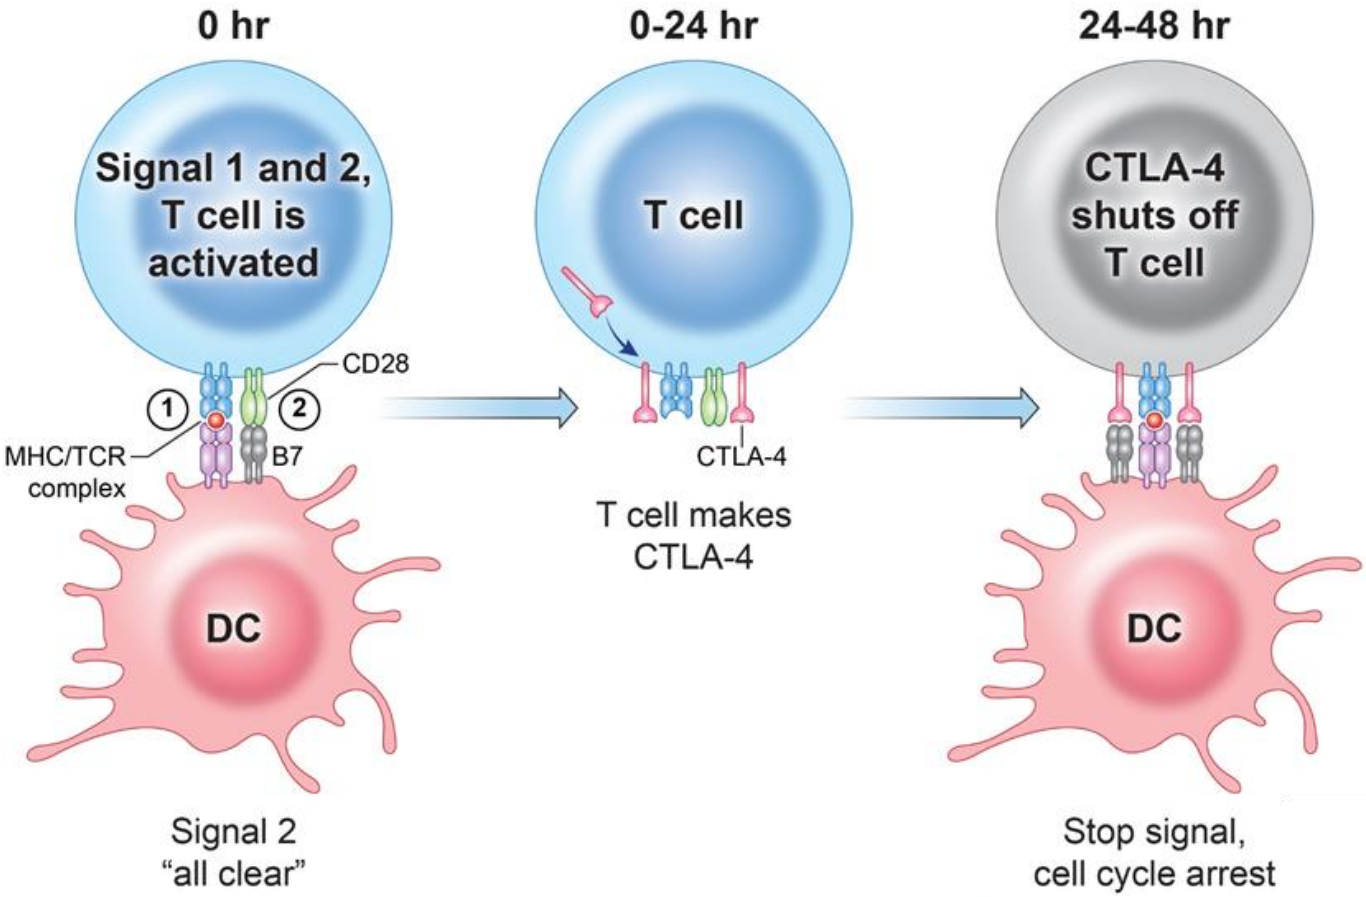
ADVANCES IN Cancer IMMUNOTHERAPY™

T cell checkpoint modulation



ADVANCES IN Cancer IMMUNOTHERAPY™

CTLA-4, a negative regulator of T cell activity limits the responsiveness of activated T cells



ADVANCES IN Cancer IMMUNOTHERAPY™

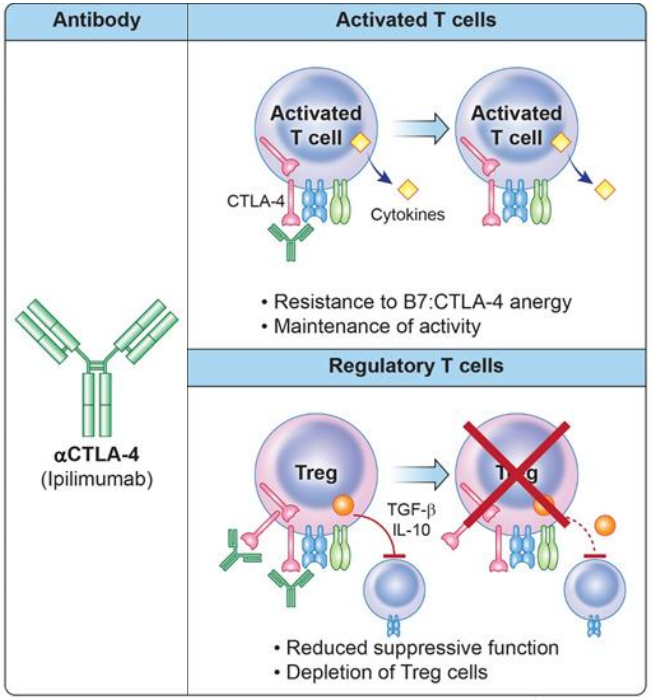
Which T cells are affected by ipilimumab (αCTLA-4)?



The efficacy and selectivity of anti-CTLA-4 therapy increase in patients who have higher percentages of activated tumor-specific T cells at the time of treatment

ADVANCES IN Cancer IMMUNOTHERAPY™

PD-1: PD-L1 inhibitory pathway

- PD-1 signaling promotes T cell tolerization by inhibiting downstream activation signals
- PD-1 expression is upregulated by activated and exhausted T cell populations
- T cell surface PD-1 receptor binds to and is activated by PD-L1 and PD-L2
- Many cells within the tumor microenvironment express PD-L1/PD-L2 allowing for the suppression of T cell activation
- Tumor PD-L1 expression is regulated via two general mechanisms:
  1. TIL production of IFN-γ
  2. Oncogenic signaling pathways

ADVANCES IN Cancer IMMUNOTHERAPY™

To exist, tumors must evolve mechanisms to locally disable and/or evade the immune system.

The goal of T cell checkpoint blockade is to make T cell “off-switches” inaccessible to tumor cells, thus restoring tumor-specific immunity.

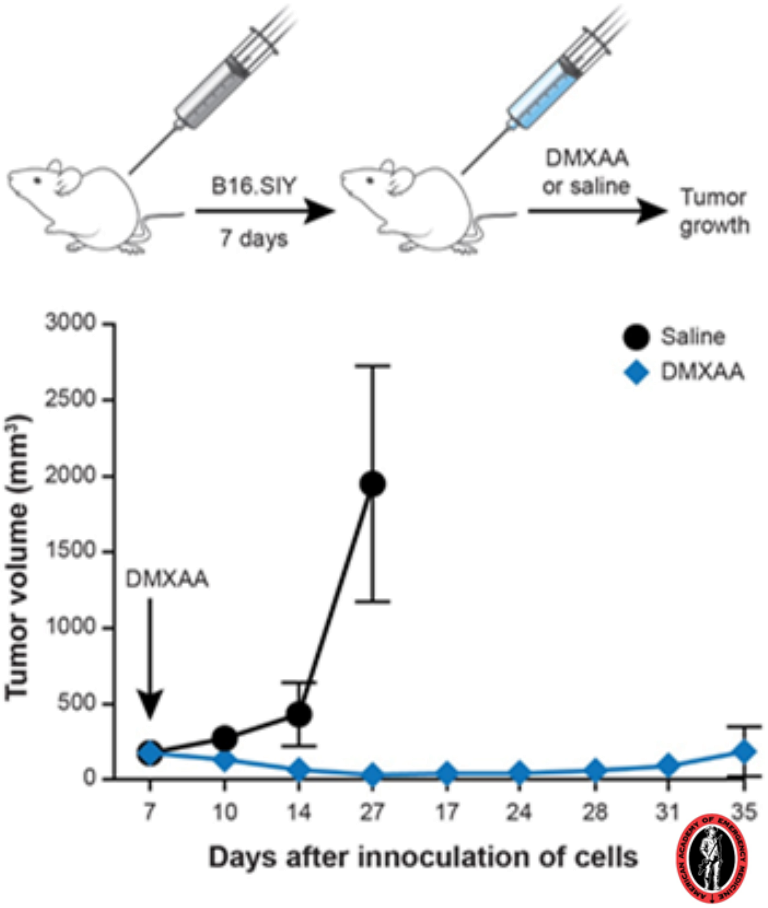
Intratumoral injection of innate immune agonists: The direct vaccination approach

Intratumoral DMXAA (mouse STING agonist) triggers rejection of B16 melanoma



Corrales L and Gajewski TF

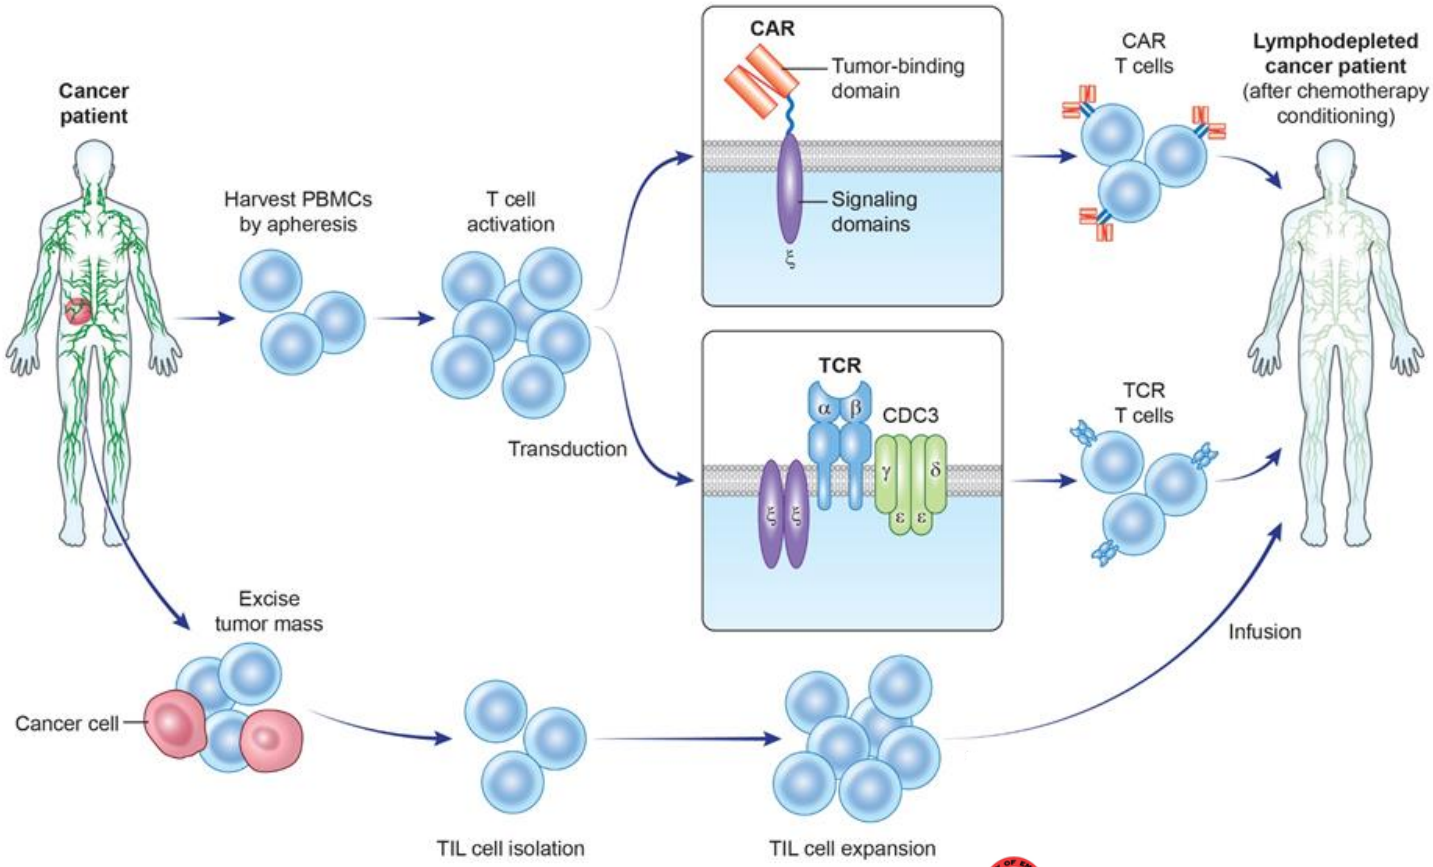
ADVANCES IN Cancer IMMUNOTHERAPY™

To exist, tumors must evolve mechanisms to locally disable and/or evade the immune system.

The goal of therapeutic cancer vaccination is to increase the immunogenicity of tumor antigens which are poorly presented by the tumor in order to generate a high frequency of tumor-specific T cells.

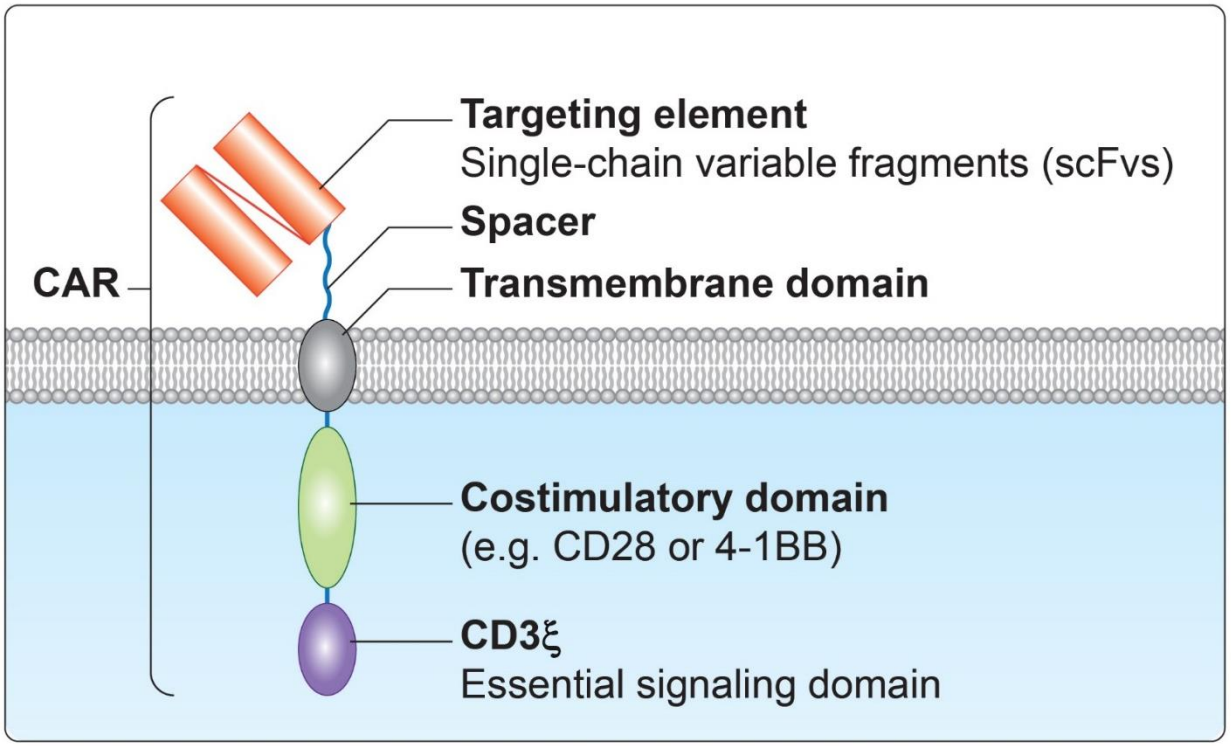
ADVANCES IN Cancer IMMUNOTHERAPY™

Adoptive T cell therapy can involve engineered (CAR, TCAR) or patient-derived (TIL, PBMC) T cells



ADVANCES IN Cancer IMMUNOTHERAPY™

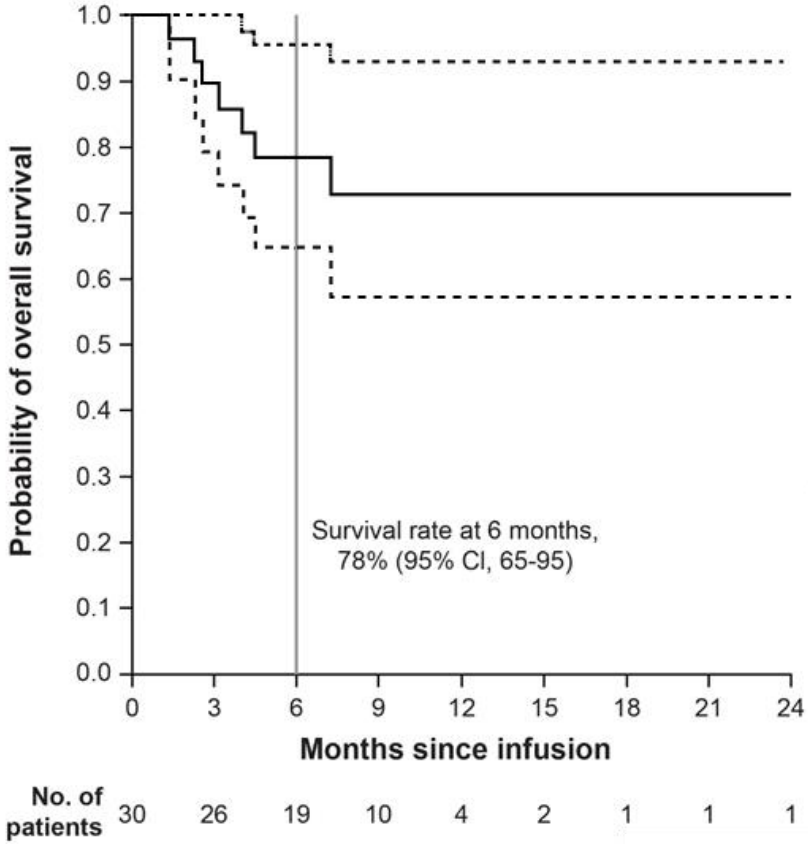
T cell adoptive transfer

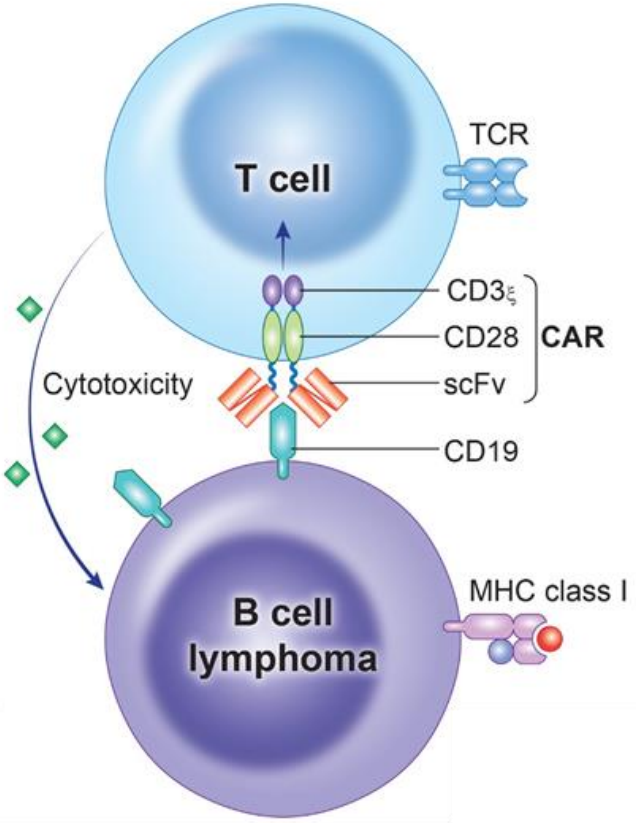


CARs, TIL, TCR, PBMCs

ADVANCES IN Cancer IMMUNOTHERAPY™

Effective treatment of relapsed B cell ALL with CD19 CAR T cell therapy





Maude S, Frey N, Shaw P, Aplenc R, Barrett D, Bunin N, Chew A, Gonzalez V, Zheng Z, Lacey S, et al. 2014. Chimeric antigen receptor T cells for sustained remissions in leukemia. The New England Journal of Medicine. 374(10): 998.

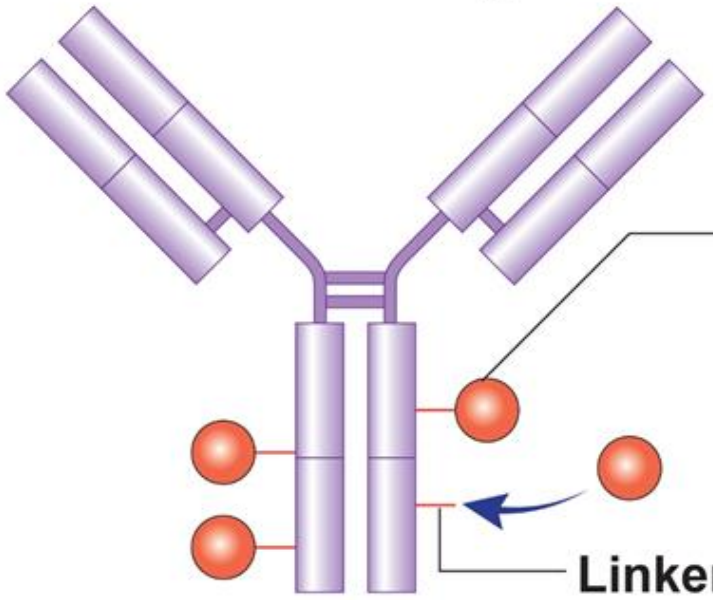
ADVANCES IN Cancer IMMUNOTHERAPY™

To exist, tumors must evolve mechanisms to locally disable and/or evade the immune system.

The goal of T cell adoptive transfer is to win the numbers game and overwhelm the tumor with a higher frequency of tumor-specific T cells than it is capable of suppressing.

ADVANCES IN Cancer IMMUNOTHERAPY™

Effector antibodies and antibody-drug conjugates (ADCs)



Antibody
Specific to tumor-associated antigen

Radiolabeled or Cytotoxic agent
Designed to kill target cells when internalized and released or activated

Linker
Attaches cytotoxic agent to the antibody

ADVANCES IN Cancer IMMUNOTHERAPY™

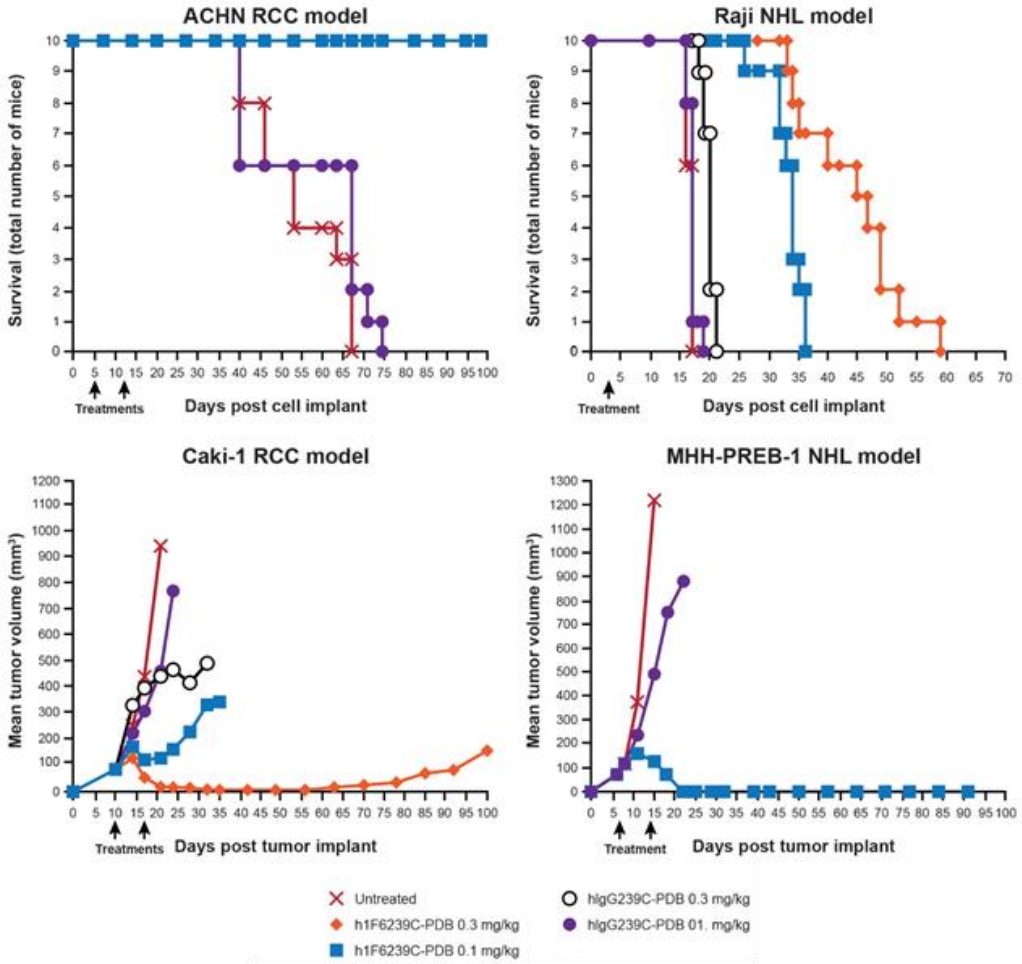
Key ADC / antibody principles

- **Specificity:** The more tumor specific the target antigen is, the higher the agent can be dosed without limiting toxicity

- **Internalization:** The target tumor surface protein must internalize to deliver the toxin - it should do so frequently and to a suitable endosomal compartment.

- **Stability:** The toxin must remain inert and tethered to the antibody until it is delivered to its target cell.

SGN-70A in the clinic for NHL and RCC



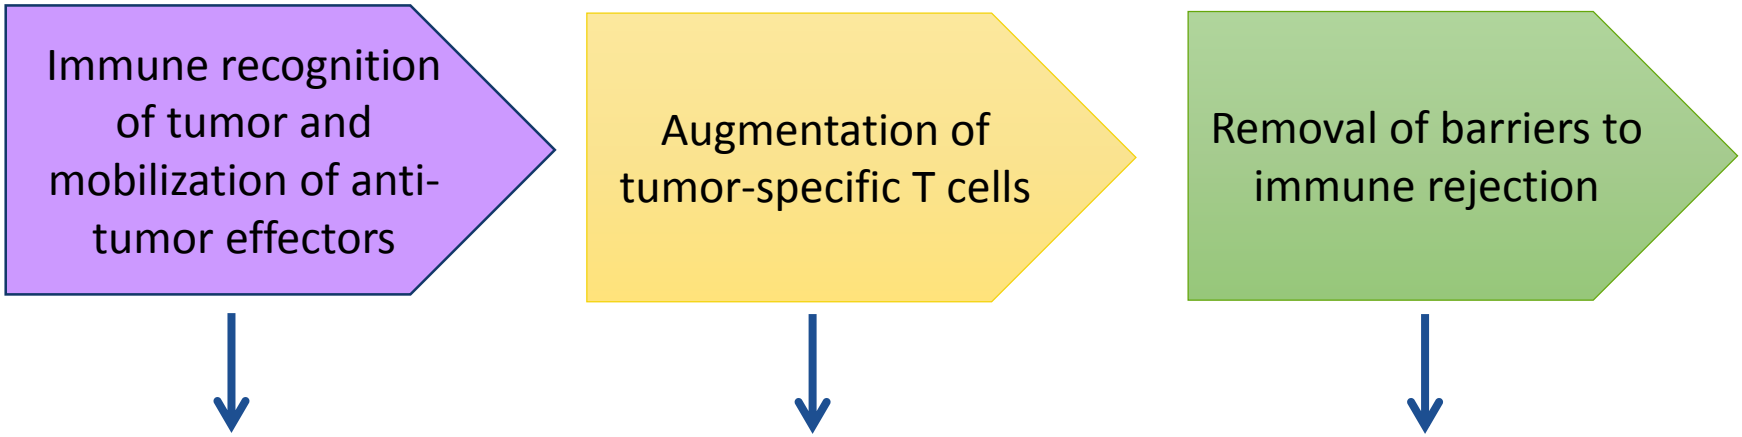
Jeffrey SC et al. 2013. Bioconjug Chem. 24(7): 1256-63

ADVANCES IN Cancer IMMUNOTHERAPY™

To exist, tumors must evolve mechanisms to locally disable and/or evade the immune system.

The goal of effector antibodies is to utilize the exquisite sensitivity of antibodies to specifically target and kill tumor cells using mechanisms which are difficult to evade or suppress.

ADVANCES IN Cancer IMMUNOTHERAPY™



- Vaccines
- Chemotherapy
- Radiation
- ACT (CARs, TCR transfer)

- Co-inhibitory blockade
- Co-stimulatory activation
- Activation of APCs
- Innate immune recognition

- Tumor vascular resistance
- Desmoplastic stroma
- Hypoxic microenvironments
