# Disclosures

**Patents:** LAG-3 (BMS), IL-35 (Tizona) and Nrp1 (Potenza), granted and pending.

**Founder:** Potenza Therapeutics Inc, Tizona Therapeutics Inc., TTMS Inc.

**Stock Owner:** Potenza Therapeutics Inc, Tizona Therapeutics Inc., TTMS Inc., Oncorus Inc.

**SAB:** Potenza, Tizona, Oncorus, F-Star, Pieris.

**Consultation:** Crescendo, MPM.

I will be discussing non-FDA approved indications during my presentation.

**Only a subset of patients (~10-30%) exhibit substantive benefit from immunotherapy**

# Cancer Immunotherapy: What's Next?

# Cancer Immunotherapy: Overcoming PD1 Resistance

VOLUME 32 · NUMBER 10 · APRIL 1 2014

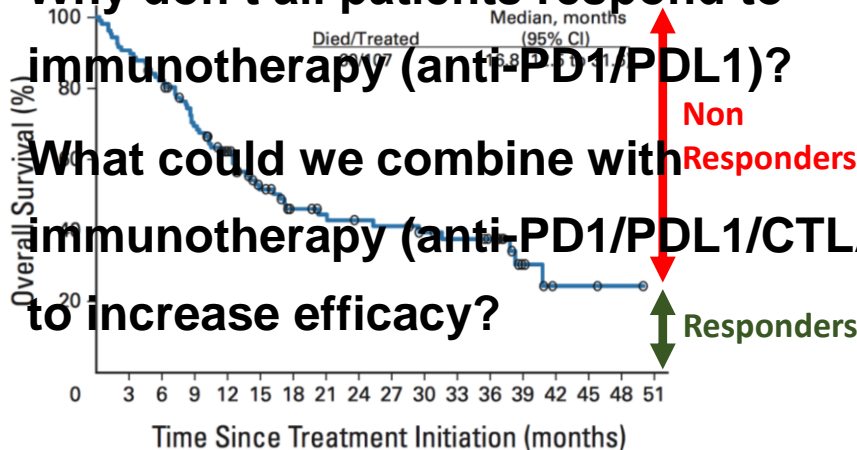

JOURNAL OF CLINICAL ONCOLOGY

ORIGINAL REPORT

Survival, Durable Tumor Remission, and Long-Term Safety  
in Patients With Advanced Melanoma Receiving Nivolumab

**Two key questions:**

- Why don't all patients respond to immunotherapy (anti-PD1/PDL1)?
- What could we combine with immunotherapy (anti-PD1/PDL1/CTLA4) to increase efficacy?

# Cancer mutations and response to immunotherapy

# Overcoming “resistance” to immunotherapy

- Vaccines
- Adoptive T-cell therapies
  - CAR-T
  - TIL therapy

- Cytokines
- TLR agonists
- Agonist antibodies (4-1BB, OX-40, etc)

# Overcoming “resistance” to immunotherapy

- Vaccines
- Adoptive T-cell therapies
  - CAR-T
  - TIL therapy

- Cytokines
- TLR agonists
- Agonist antibodies (4-1BB, OX-40, etc)

# Overcoming “resistance” to immunotherapy

- Vaccines
- Adoptive T-cell therapies
  - CAR-T
  - TIL therapy

- Cytokines
- TLR agonists
- Agonist antibodies (4-1BB, OX-40, etc)

- Checkpoint blockade (Abs blocking CTLA4, PD-1/PD-L1, LAG3, TIGIT, TIM-3, etc)

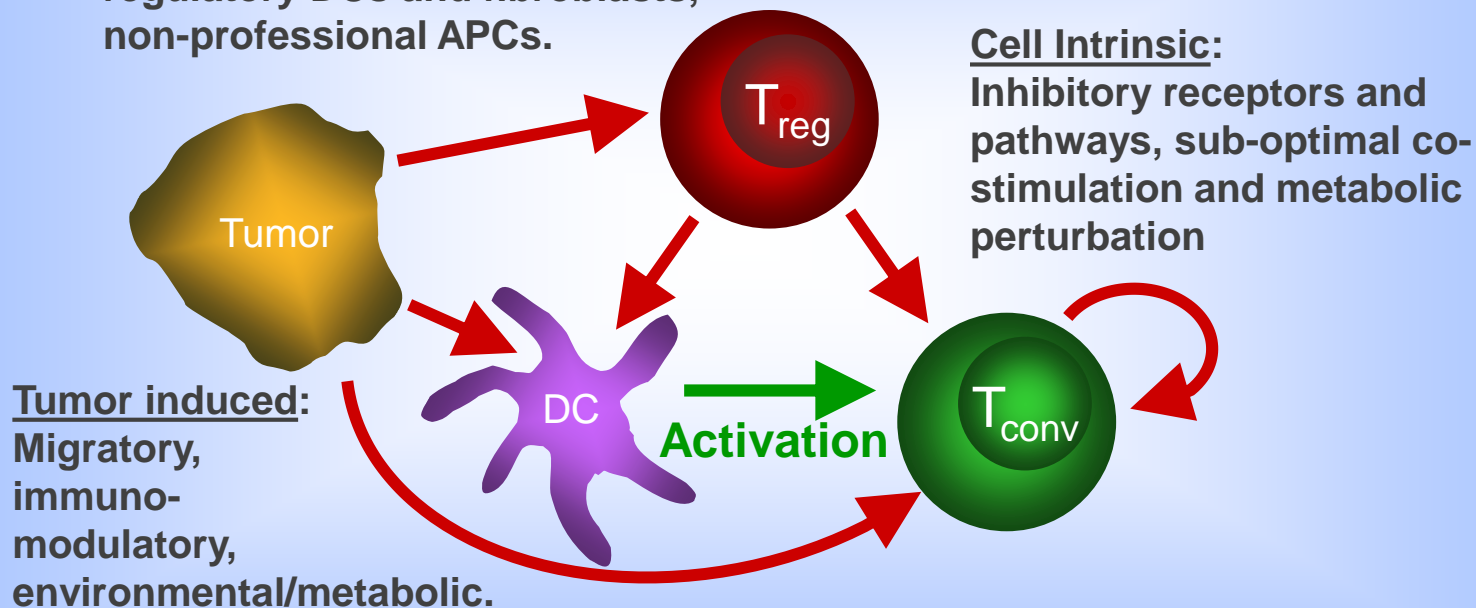

- Manipulating the tumor environment

# Checkpoints in Anti-Tumor Immunity

## Cell Extrinsic:

Cytokines (IL-10, TGF $\beta$ ), regulatory T cells (T<sub>regs</sub>), MDSCs, TAMs, regulatory DCs and fibroblasts, non-professional APCs.

*Immunity* (2004) 21:503; *Jl-CE* (2002) 169:5392; *Jl* (2005) 174:688; *EMBOJ* (2007) 26:494; *Nature* (2007) 450:566; *Jl* (2009) 182:6121; *Nature Immunology* (2010) 11:1093; *Nature Immunology* (2012) 13:290; *Immunity* (2012) 36:717; *Nature* (2013) 501:252; *Immunity* 44:316 (2016), *Science Immunology* 2:eaah4569 (2017), *Cell* 169:1130 (2017).

# Developing Cancer Immunotherapies

- Regulatory T cells are potent suppressive cells that prevent autoimmune and inflammatory disease.
- However, they can also be a major barrier to anti-tumor immunity.
- How can we selectively target them for therapeutic efficacy in cancer?
- Vignali lab has previously shown that a molecule called Neuropilin-1 is required for regulatory T cells to work in tumors but is dispensable elsewhere in the body (*Nature* 501:252, 2013, *Cell* 169:1130, 2017).
- Neuropilin-1 is not expressed by regulatory T cells in healthy subjects.
- However, a high proportion of regulatory T cells in cancer patients express neuropilin-1 and this correlates with a poor survival outcome (*Cell* 169:1130, 2017).
- Biotech start-up founded in 2014 to develop a drug that targets Neuropilin-1. Clinical trial was started in August 2018.

# LAG3 is the third checkpoint target to enter the clinic

# Multiple Immuno-Inhibitory Pathways Regulate T cell Tolerance and T cell Exhaustion

Cancer  
Research

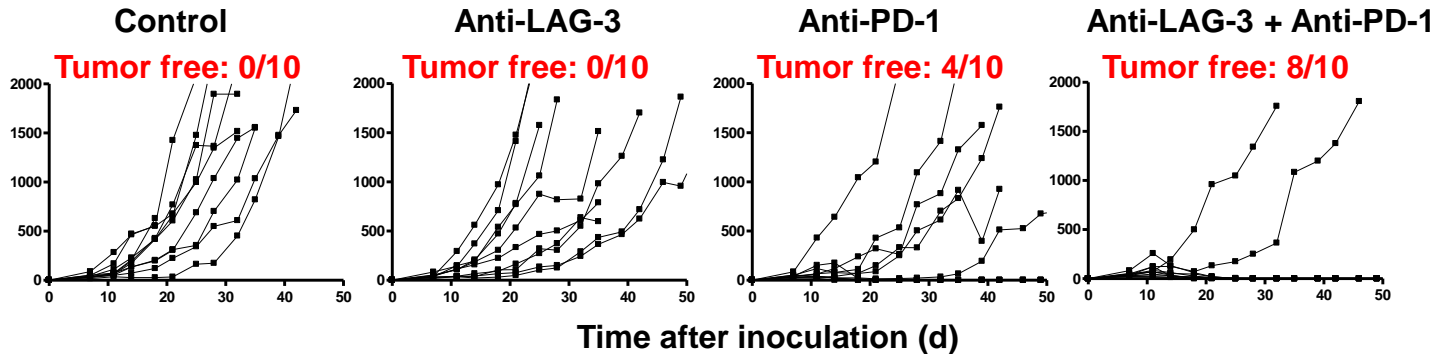

# Tumor clearance with combinatorial anti-LAG-3 / anti-PD-1 treatment

Sa1N Fibrosarcoma - A/J mice (Ab treatment = 10mg/kg at day 8, 11, 14)

MC38 Adenocarcinoma – C57BL/6 mice (Ab treatment = 10mg/kg at day 8, 11, 14)

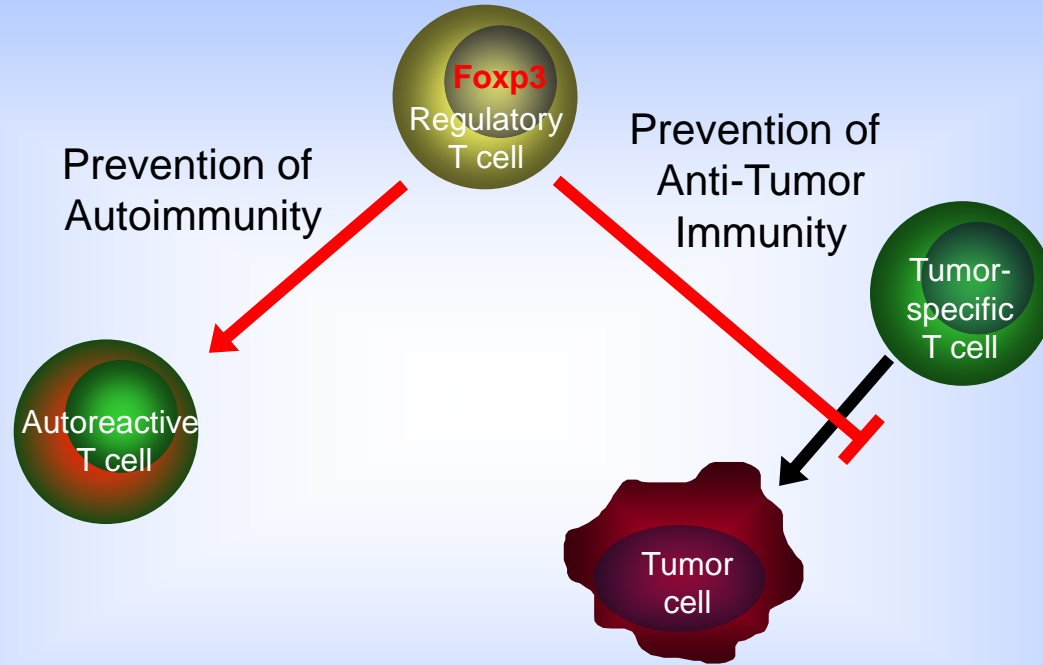

# Overall response rate to Relatlimab in IO-unresponsive melanoma patients is 13% (20% in LAG3 $\geq 1\%$ )

## Melanoma Prior-IO Cohort

# Regulatory T cells - The Master Controller

**What is the impact of  $T_{reg}$  on cancer prognosis?**

**Would targeting  $T_{regs}$  have a therapeutic benefit in cancer?**

# Significance of regulatory T cells in human cancer

Curiel et al, Nat Med 2004

Saito et al, Nat Med 2016

- $T_{regs}$  are elevated in the peripheral blood of cancer patients and infiltrate tumor tissue.
- Increased intratumoral  $T_{reg}$  frequency correlates with reduced survival in multiple solid tumors.

# The impact of $T_{regs}$ on tumor growth

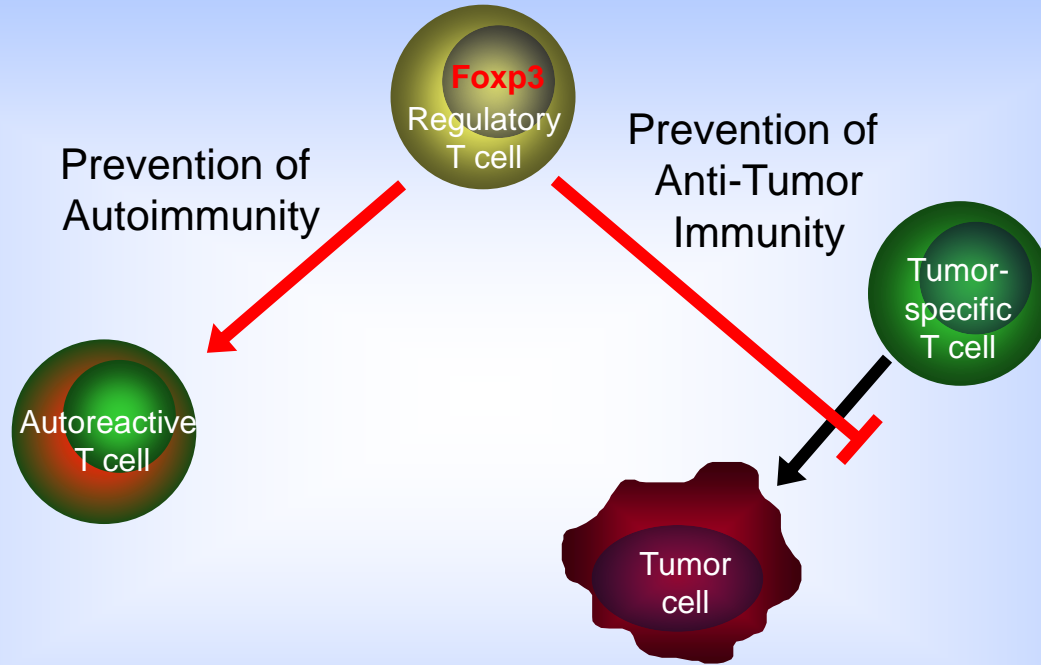

## MC38 Adenocarcinoma

## B16 Melanoma

# Regulatory T cells - The Master Controller

**Is it possible to limit the activity of  $T_{\text{regs}}$  in tumors without inducing systemic autoimmune or inflammatory reactions?**

# Targeting $T_{reg}$ in Tumors: What is the optimal approach?

- Intratumoral  $T_{reg}$  depletion (eg: cytolytic mAbs to CTLA4, GITR, TIGIT):
  - Advantage: May have a bigger therapeutic index
  - Disadvantage: This may be accompanied by significant grade 3-5 AEs
- Target features that are selectively utilized or expressed in the by  $T_{regs}$  tumor microenvironment:
  - Migration (eg: CCR4)
  - Suppressive mechanisms (eg: CTLA4, GITR, TIGIT, CD39/73, IL35)
  - Stability/survival (eg: NRP1)
  - Metabolism (eg: ?)

# Research Mission and Themes

The mission of the Cancer Immunology and Immunotherapy Program (CIIP) is to reduce the burden of cancer by elucidating the basic mechanisms of interactions between the immune system and cancer, thus providing a scientific rationale for the design of new and more effective approaches for cancer treatment and prevention.
