

Webinar outline

- Discovery of 4-1BB and 4-1BB immuno-biology
 - **Byoung S. Kwon, PhD - Eutilex**
- 4-1BB as an important prosurvival signal for CAR T cells
 - **Michael Milone, MD, PhD - University of Pennsylvania**
- Novel antibody-based approaches targeting the 4-1BB pathway
 - **Christian Klein, PhD - Roche Innovation Center Zurich**
- Translational and reverse translational research in 4-1BB co-stimulation
 - **Ignacio Melero, MD, PhD - CIMA, Clinica Universidad de Navarra**

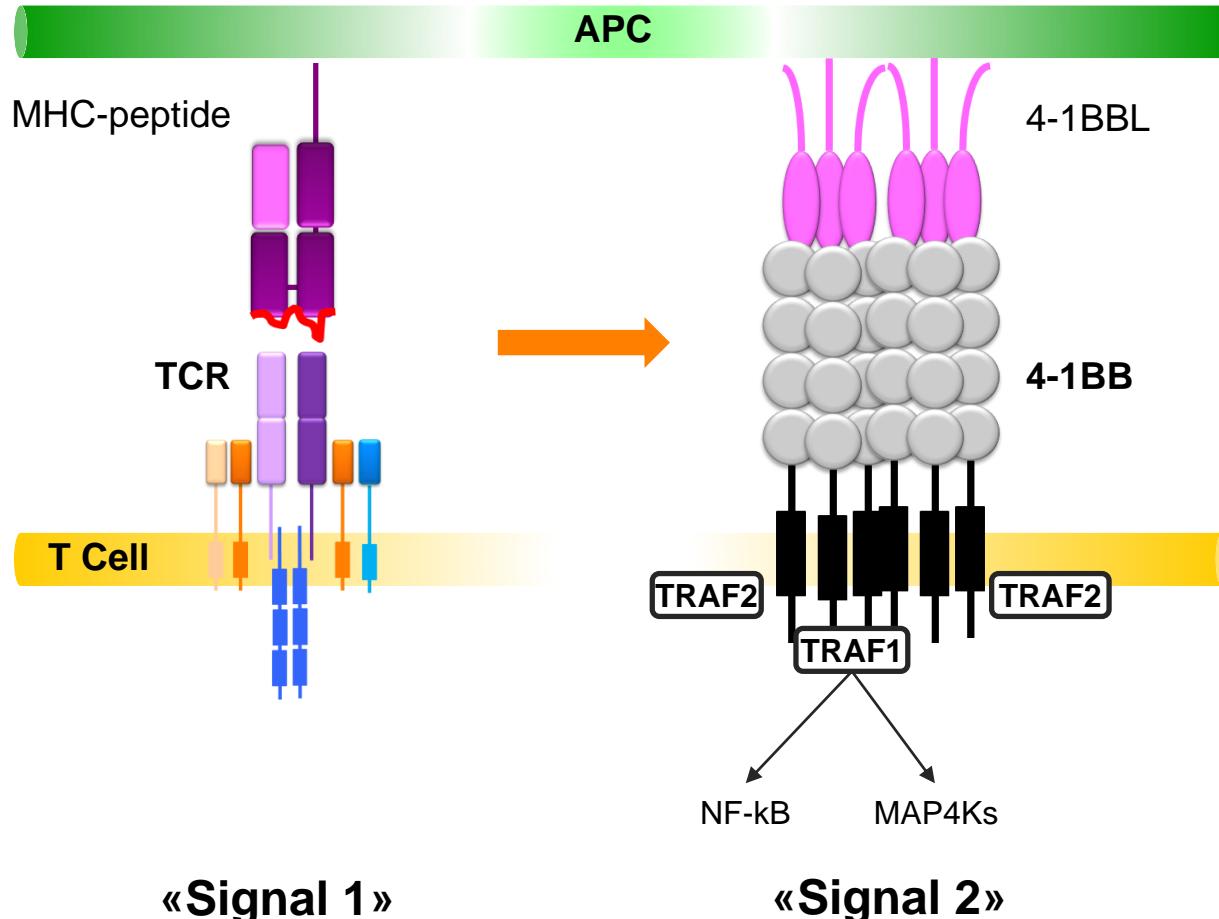

Novel antibody-based approaches targeting the 4-1BB pathway

Christian Klein

Roche Innovation Center Zurich

4-1BB (CD137) agonism enhances the strength and durability of T cell responses

4-1BB agonism enhances T cell

Proliferation

Cytotoxicity

Cytokine secretion
(e.g IFNg, IL-2, TNFa, GM-CSF)

Th1 polarization

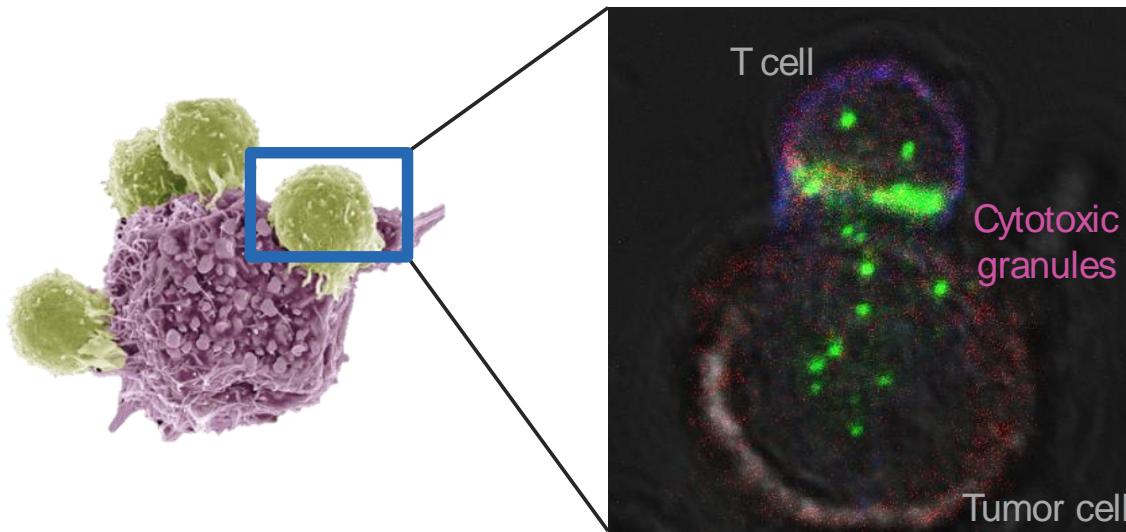

Memory formation

T cell survival (anti-apoptosis)

Resistance to exhaustion

Metabolic fitness

Mode of action of T cell bispecific antibodies (TCBs)

Simultaneous binding to tumor cell surface antigen and to common component of TCR leads to:

- TCR engagement (signal 1) and up-regulation of activation markers including 4-1BB/CD137
- T cell engagement, activation and killing of tumor cells
- T cell proliferation (expansion)
- Cytokine & chemokine secretion leading to recruitment of additional T-cells

Issues of first generation 4-1BB agonistic antibodies

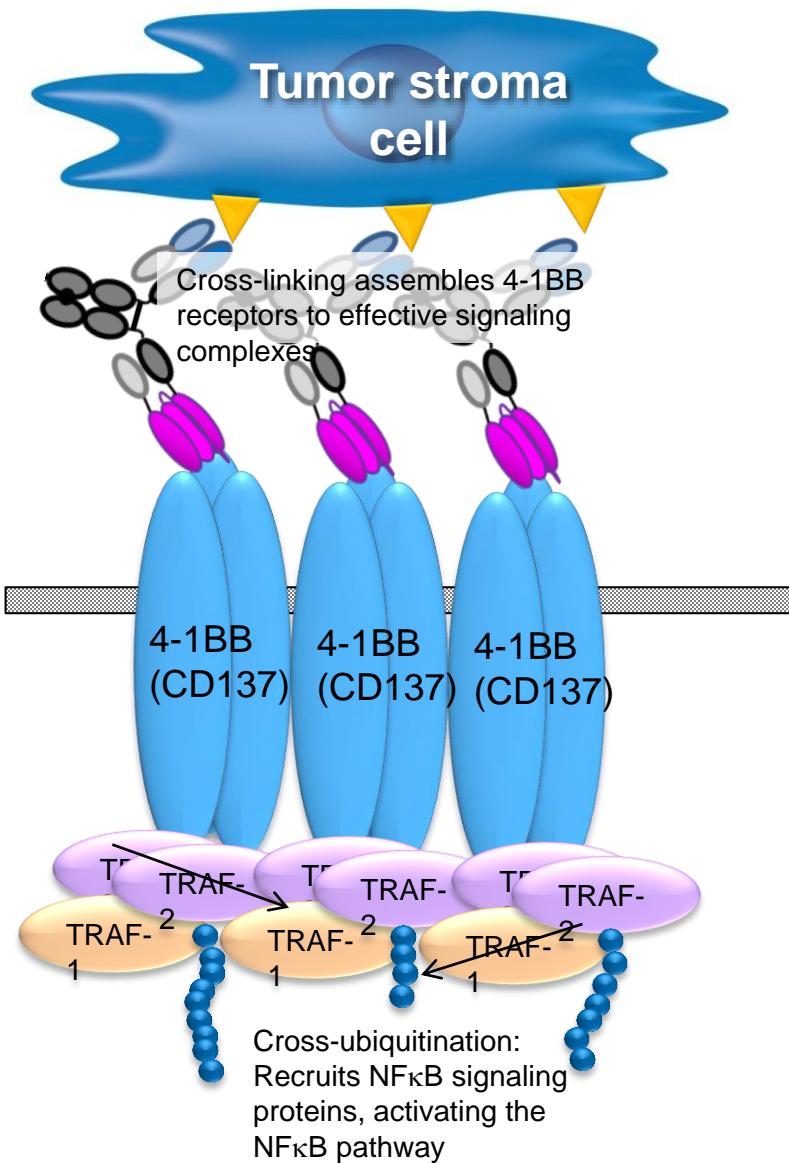

- Hypercrosslinking of 4-1BB (> 3 receptor molecules) required for effective agonism
- 1st generation 4-1BB mAbs cannot achieve this unless they are themselves hypercrosslinked by Fc_γR_s on adjacent cells
- ✓ First generation 4-1BB agonistic antibodies (e.g., urelumab) are hampered by strong hepatotoxicity and subsequent requirement for dose reduction (0.1 mg/kg)
- ✓ Dose limiting toxicity restricts efficacy as single agent and in combination

Results from an Integrated Safety Analysis of Urelumab, an Agonist Anti-CD137 Monoclonal Antibody

Tumor targeted 4-1BB agonism: Mechanism of Action

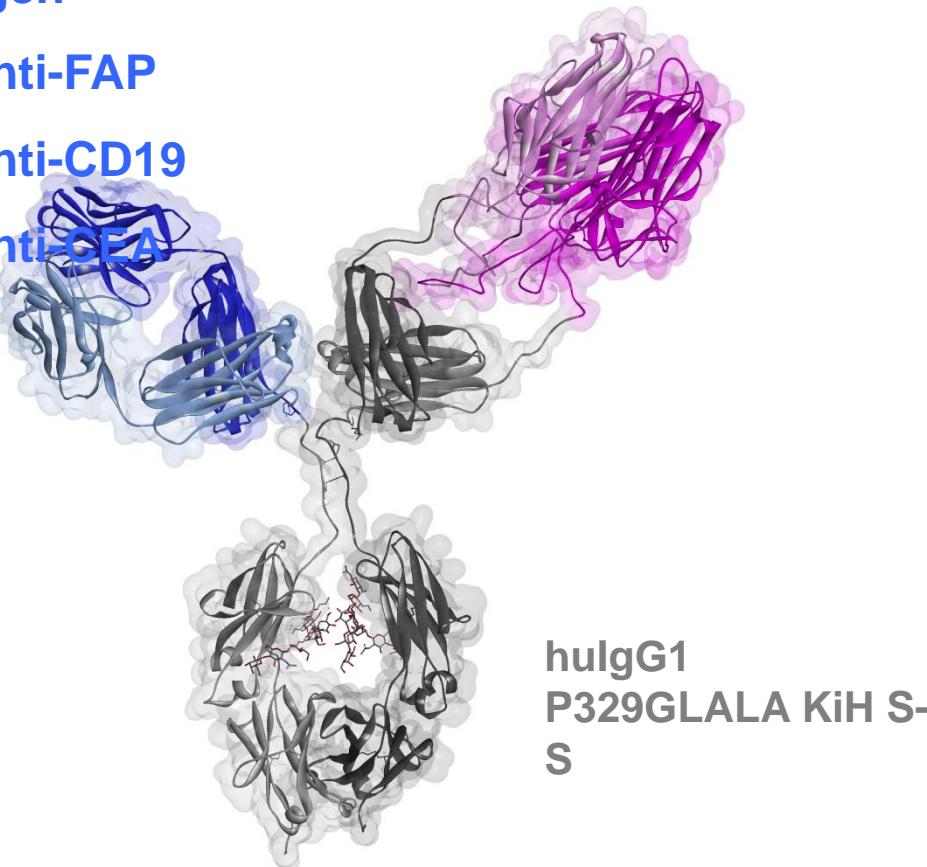

- 4-1BB is inducible and is expressed on activated T and NK cells
- Cross-linking is required for effective signaling (enables cross-ubiquitination)
- Co-stimulatory signal 2: Effects on T-Cells:
 - Enhanced effector functions and cytokine release
 - Increased proliferation
 - Anti-apoptosis

Agonistic Tumor-targeted 4-1BBL: Developed to specifically activate T cells at the tumor site but not in periphery

Tumor (stroma)
antigen

- Anti-FAP
- Anti-CD19
- Anti-CEA

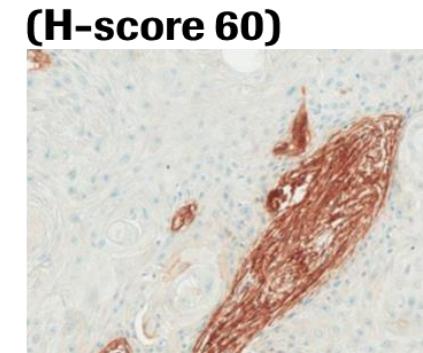

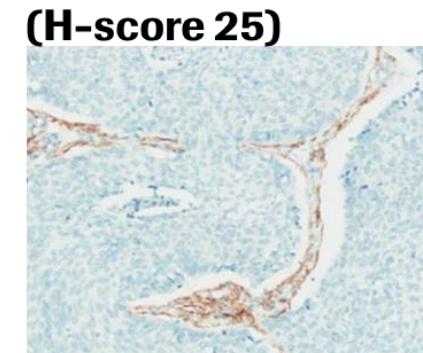

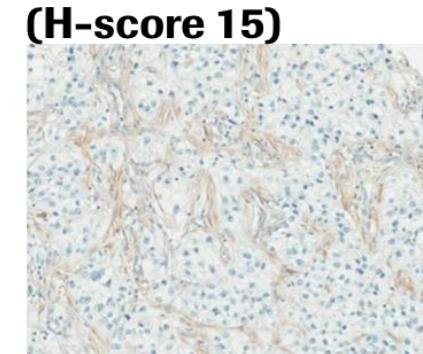

Claus et al., STM, 2019

- Reduce toxicity by eliminating Fc_γR-binding
- Deliver 4-1BB agonist to the tumor stroma (FAP) or tumor (CD19)
- Re-introduce hypercrosslinking via bispecific binding to FAP in tumor stroma
- Strictly targeting dependent via tumor antigen binding

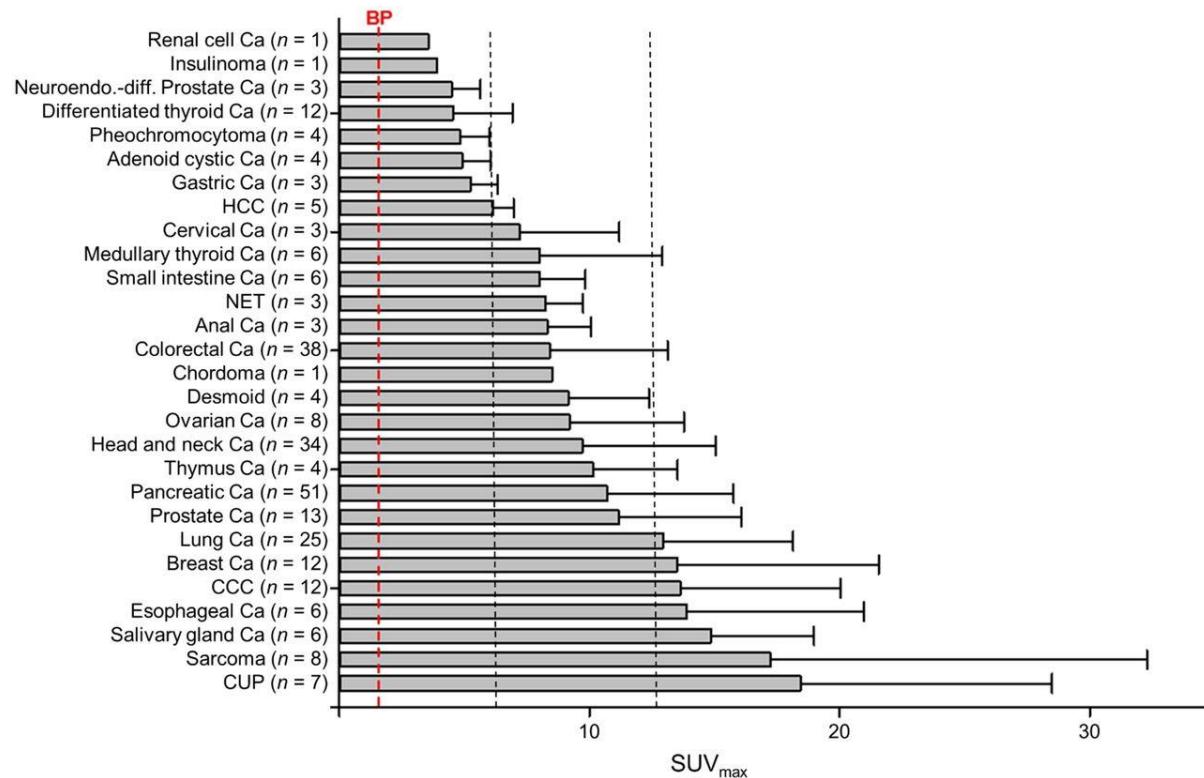

Broad FAP prevalence in major solid tumor indications by IHC

Tumor Type	IHC (n)
	H > 15
BC HER2+	91% (46)
BC TNBC	81% (48)
CRC	44% (45)
DLBCL	38% (39)
FOLLICULAR LYMPH	0% (16)
GASTRIC	62% (47)
HEAD AND NECK	66% (47)
LUNG NSCLC	83% (47)
PANCREATIC	82% (45)
RENAL CELL CARCINOMA	8% (40)
SARCOMA*	45% (40)

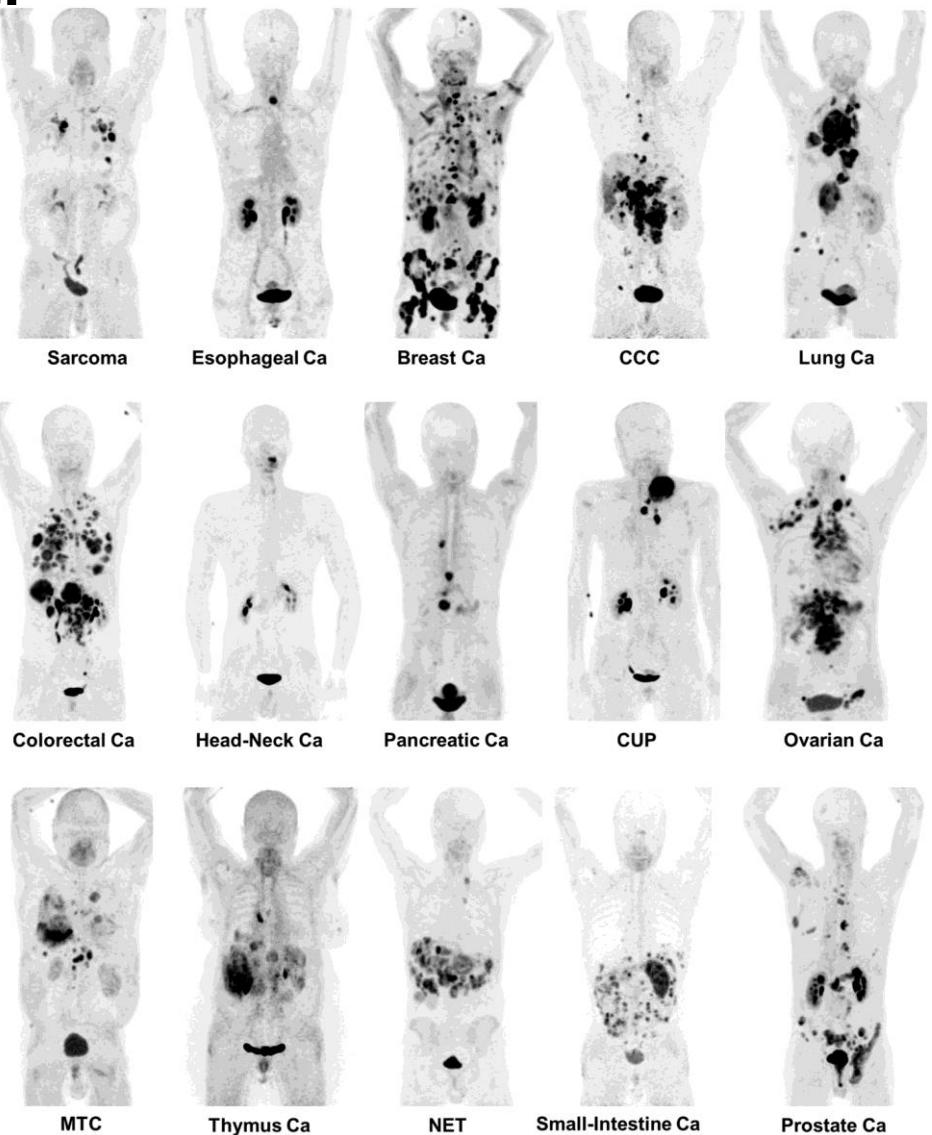

H-score™ combines the staining intensity with the percentage of positive cells

Imaging FAP in cancer patients using FAP^t

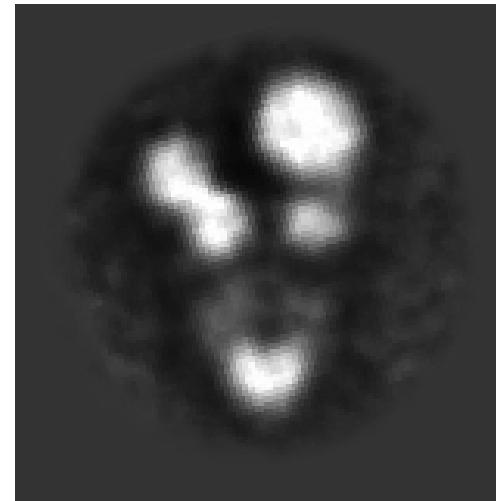

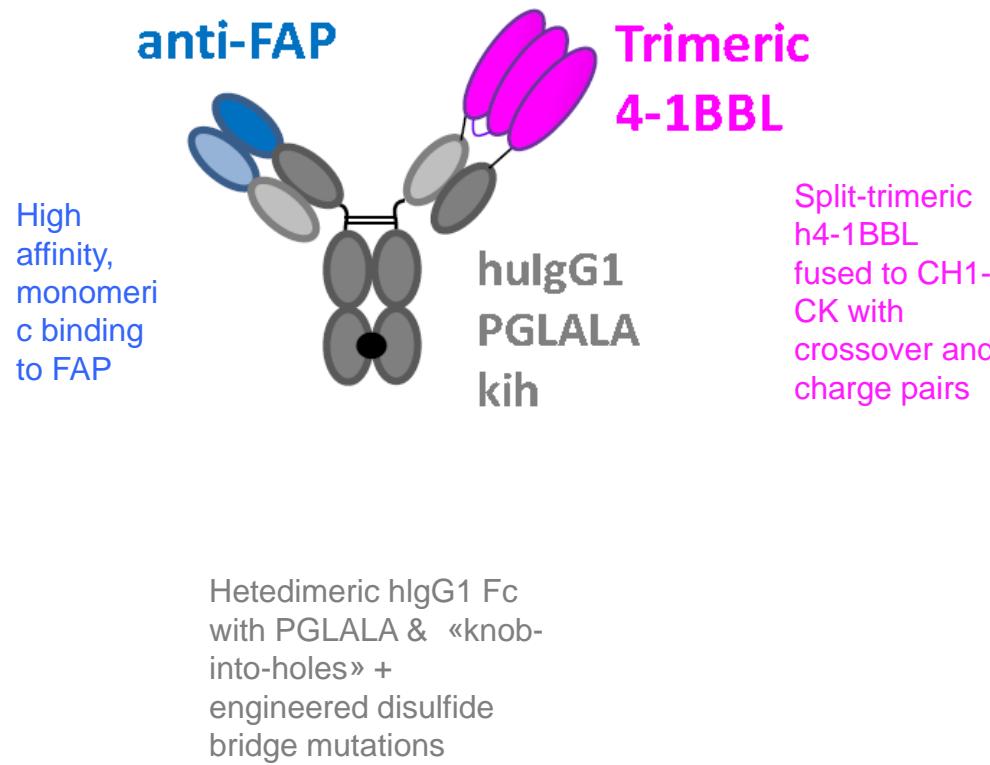

Average SUV_{max} of 68Ga-FAPI PET/CT in various tumor entities

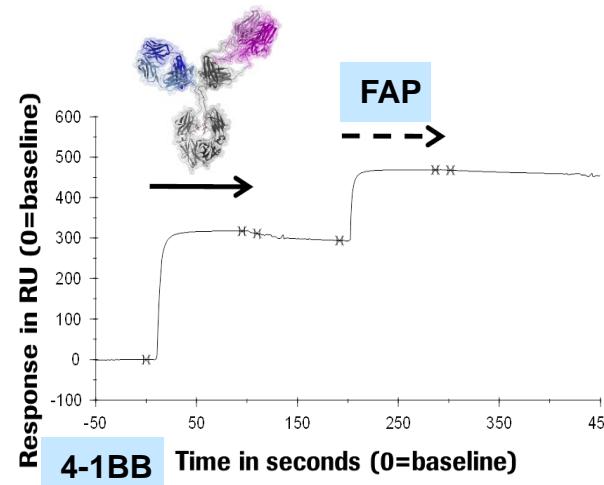

Maximum-intensity projections of 68Ga-FAPI PET/CT in patients reflecting 15 different histologically proven tumor entities (sorted by uptake in descending order).

Tumor-stroma FAP-targeted split-4-1BBL: Developed to specifically activate T cells at the tumor site

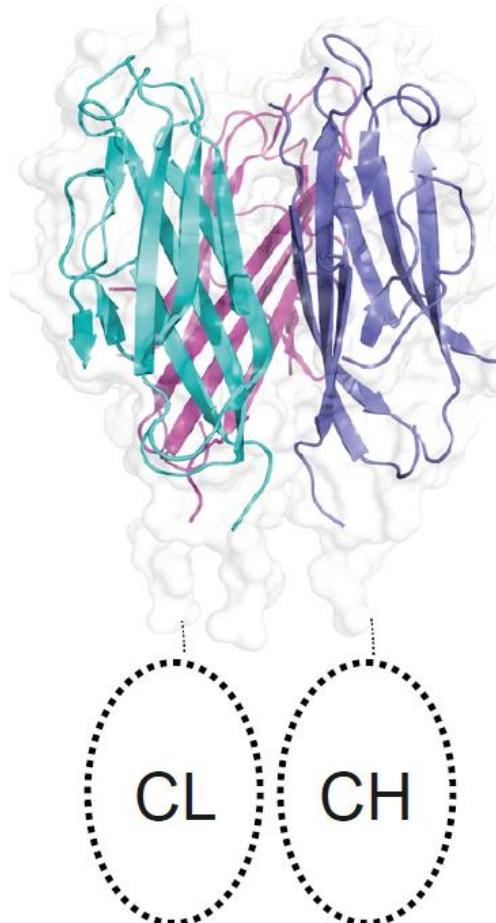

FAP-4-1BBL is a **highly flexible** molecule, able to assume **different conformations**

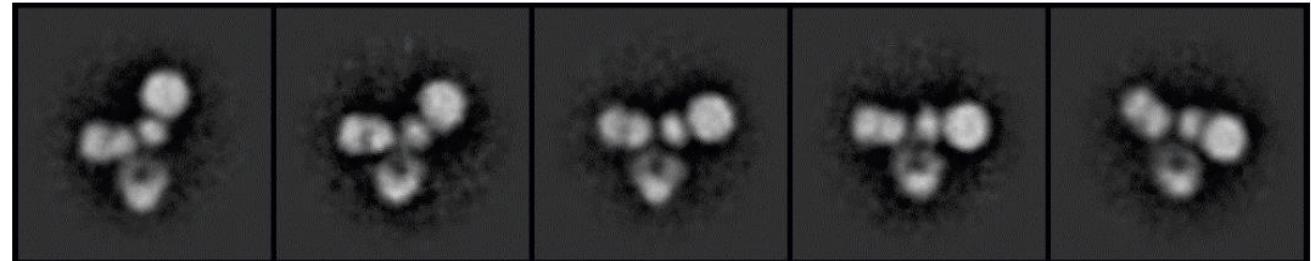

FAP-4-1BBL **binds simultaneously** to 4-1BB and FAP

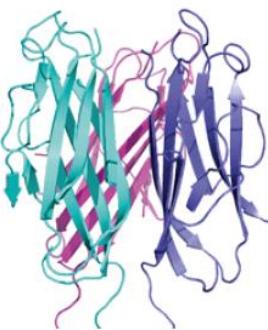

Structural analysis of 4-1BBL shows identity to published structures and TNFR superfamily

B

4-1BBL trimer
in this study

4-1BBL trimer as
published previously
(6CPR red, 6BWV grey)

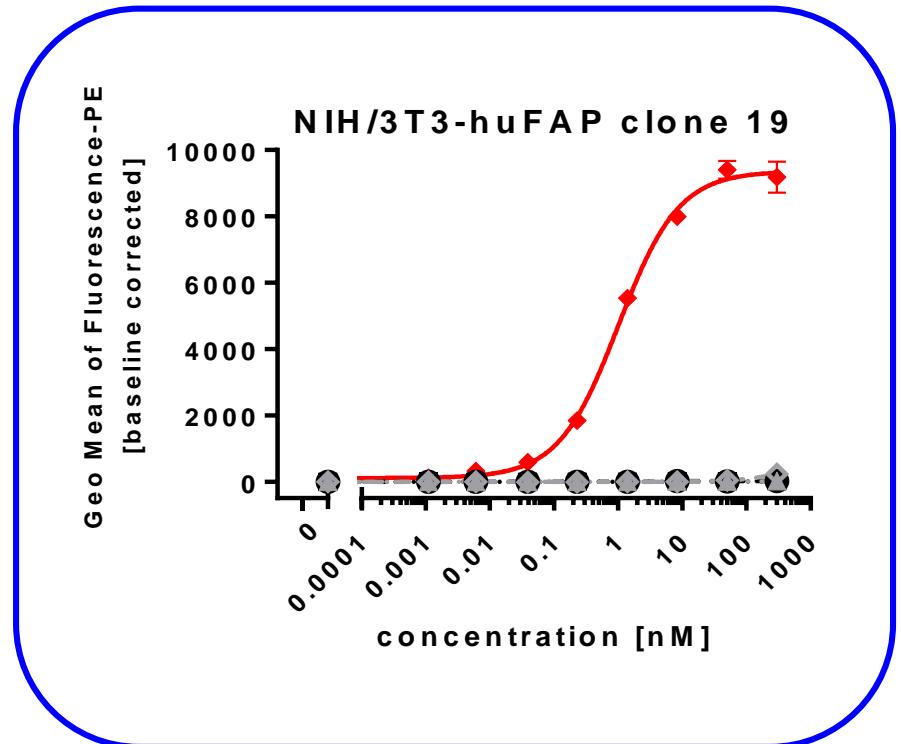

OX40L trimer (2HEW)

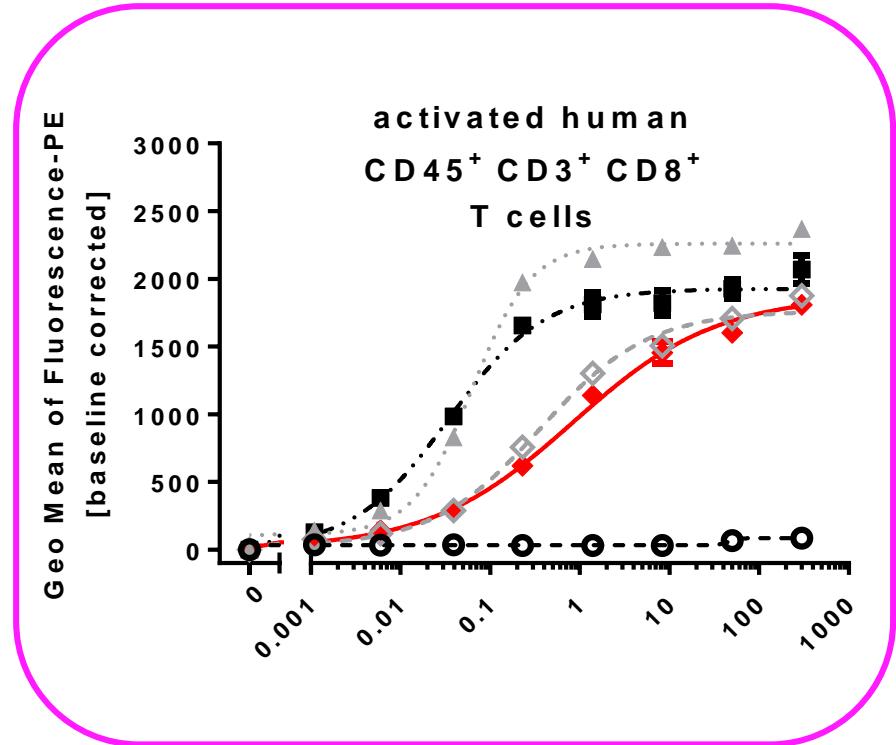

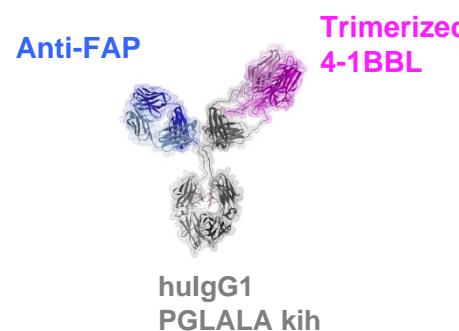

TNF trimer (1TNF)

FAP-4-1BBL binds FAP expressed on fibroblasts and 4-1BB expressed on activated human CD8 T cells

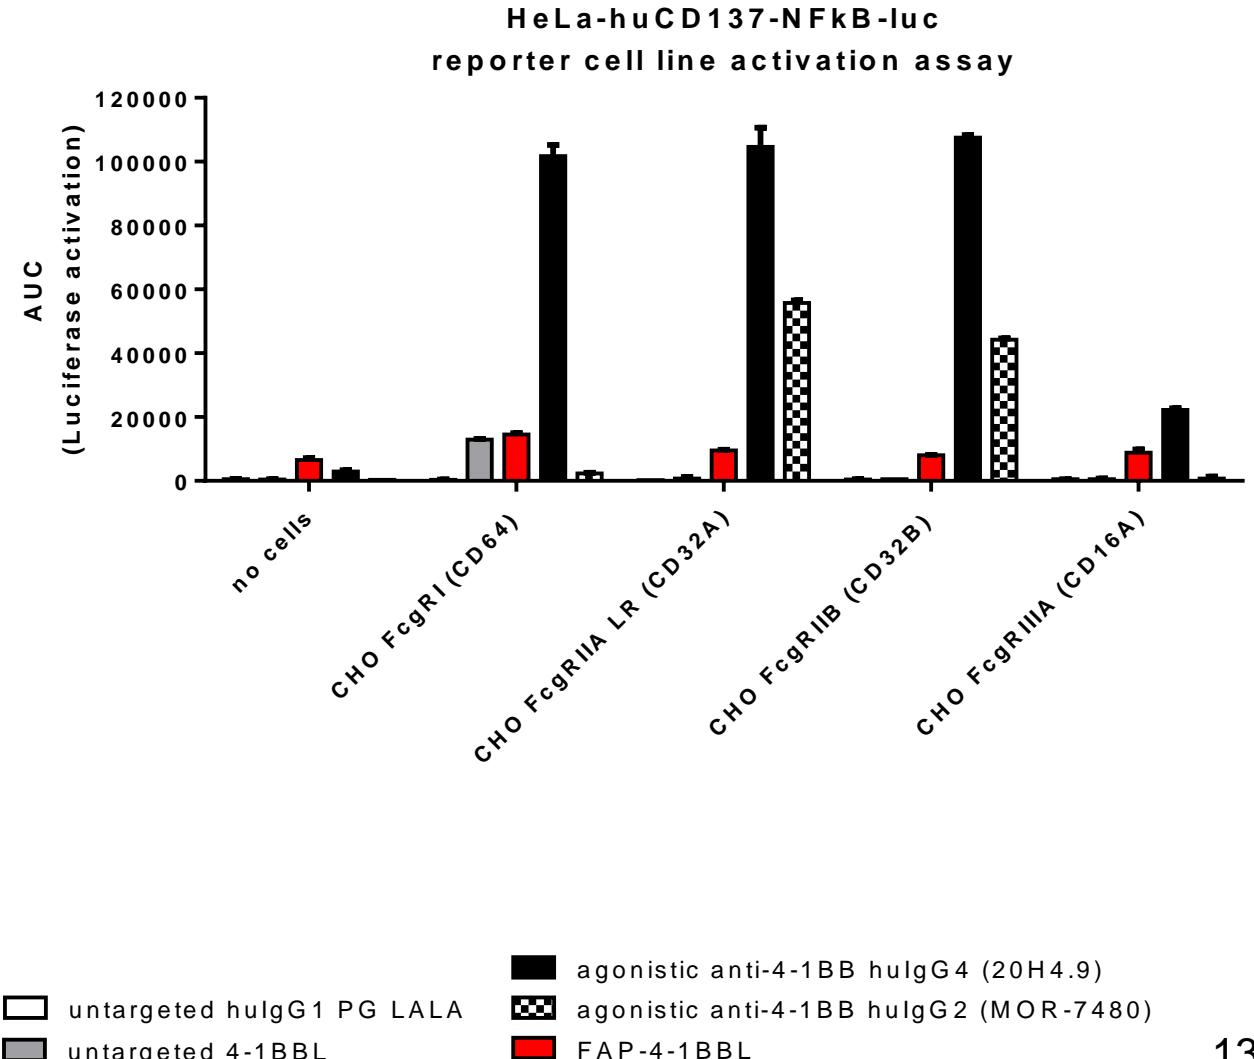

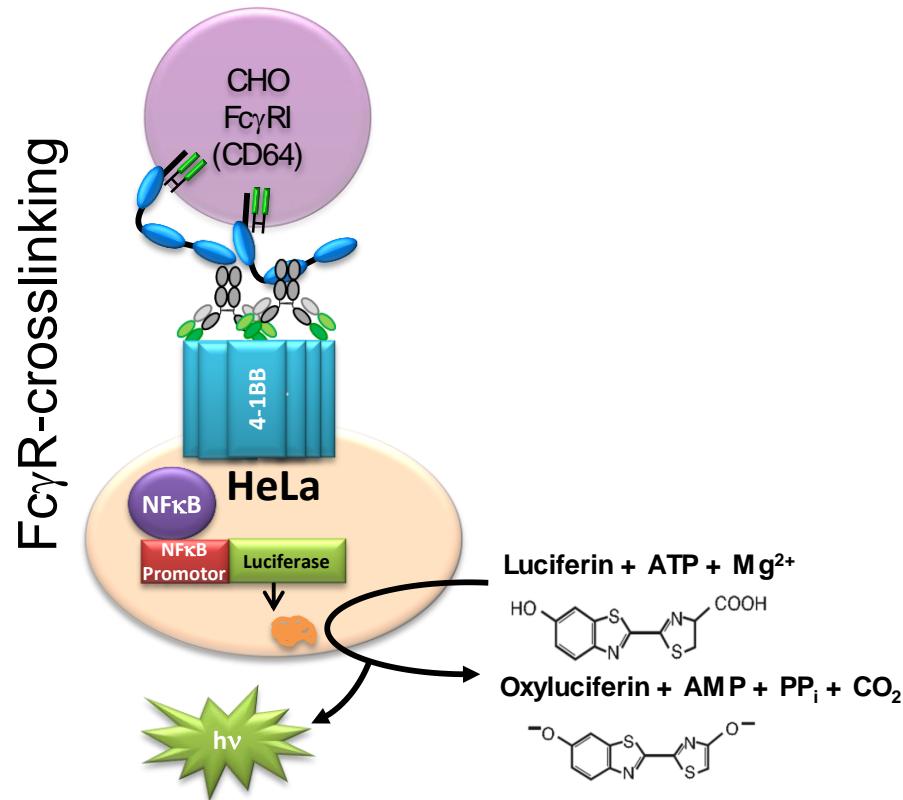

- untargeted hulgG1 PG LALA
- ◆- untargeted 4-1BBL

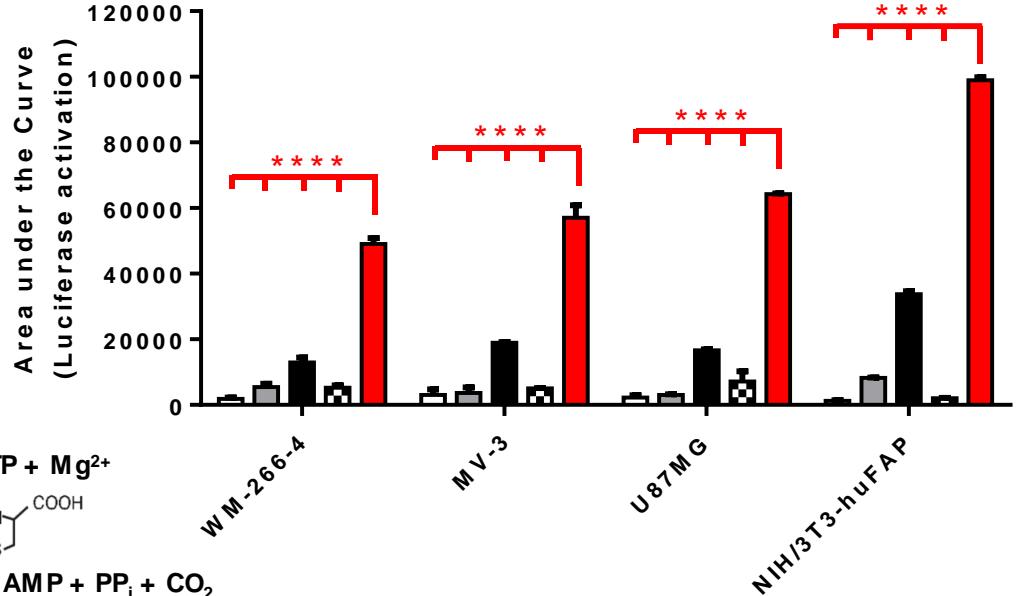

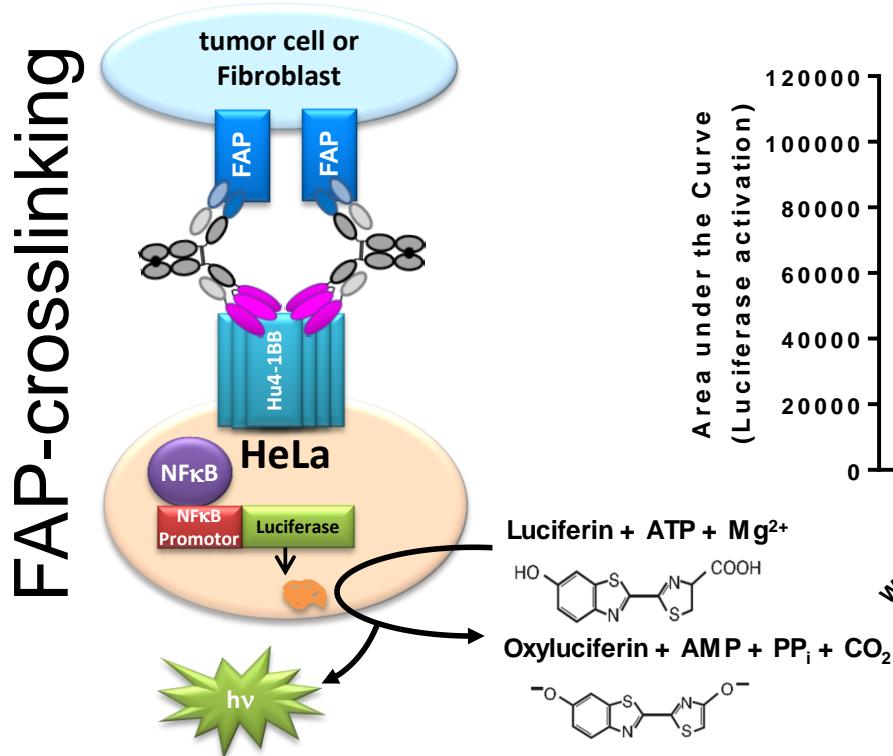

- ▲- agonistic anti-4-1BB hulgG4 (20H4.9)
- agonistic anti-4-1BB hulgG2 (MOR-7480)
- ◆- FAP-4-1BBL

Classical 4-1BB antibodies require Fc γ R crosslinking for their activity

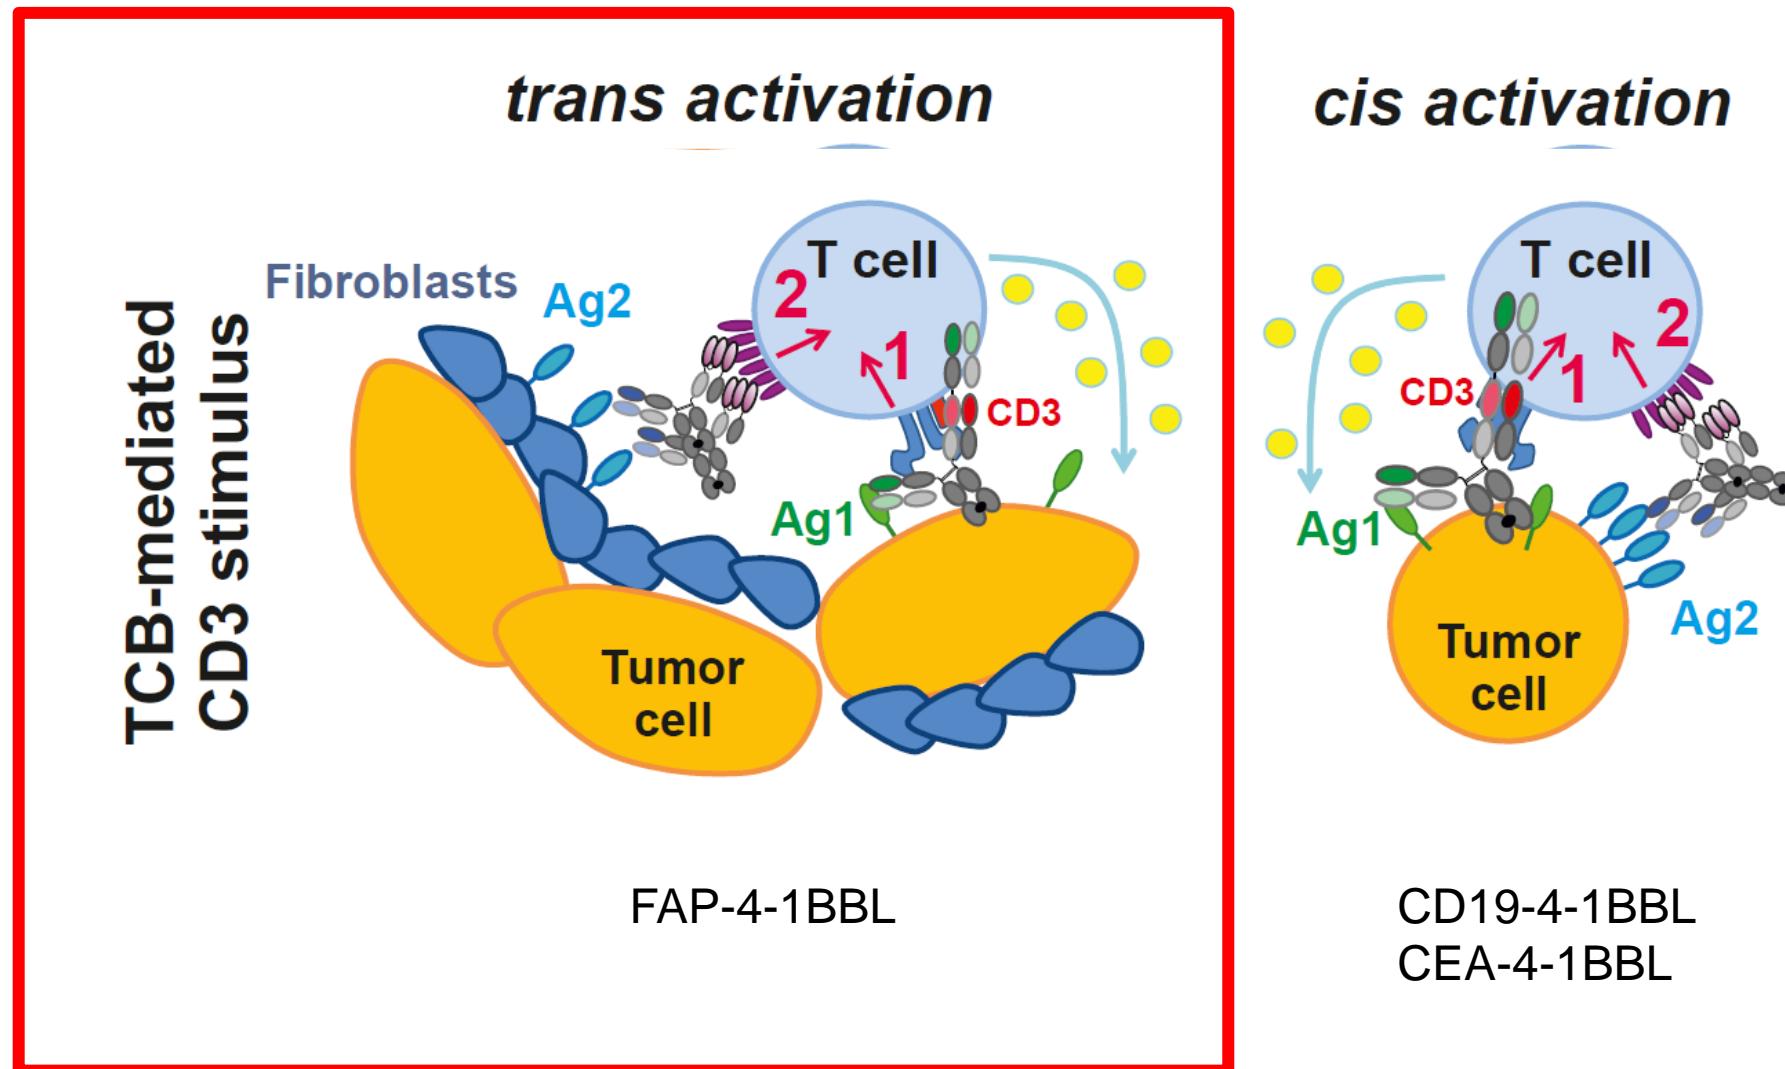

FAP-4-1BBL is only active upon FAP crosslinking

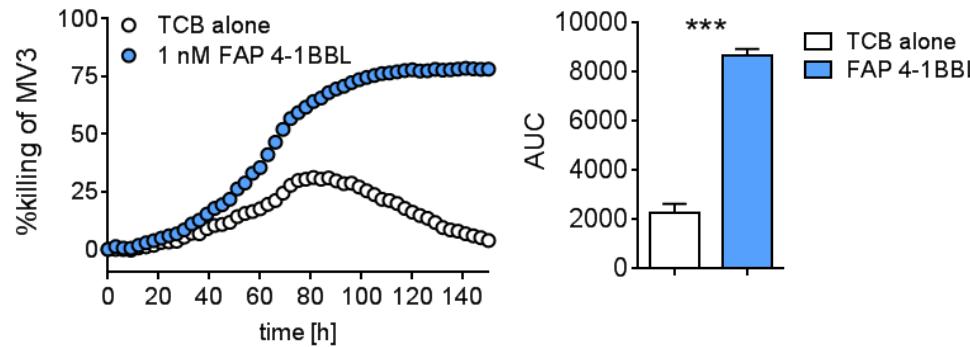

■ untargeted huIgG1 PG LALA
■ untargeted 4-1BBL
■ agonistic anti-4-1BB huIgG2 (MOR-7480)
■ FAP-4-1BBL

TA-4-1BBL provides signal 2 in presence of T cell bispecific antibodies

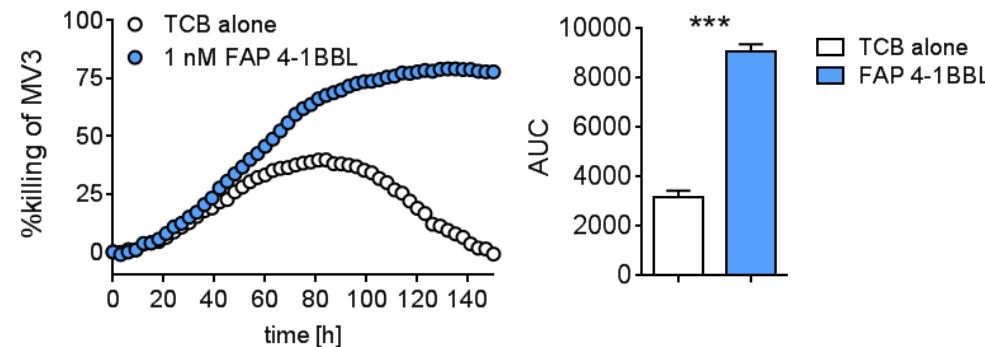

FAP 4-1BBL significantly increases TCB mediated target cell killing by pan-PBMC T cells

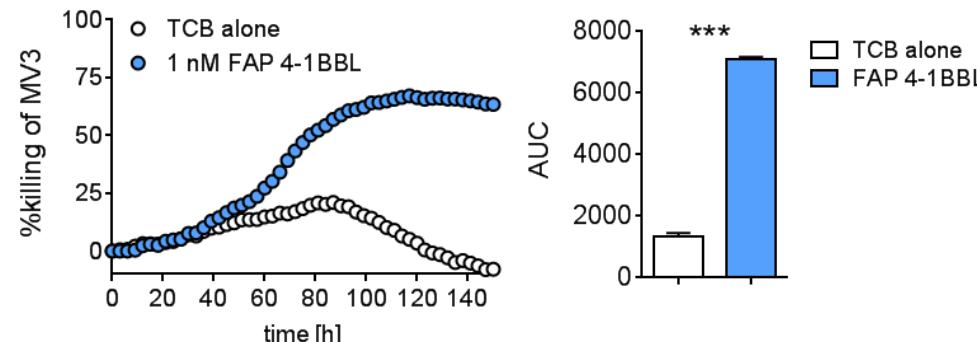

Donor 1

Donor 2

Donor 3

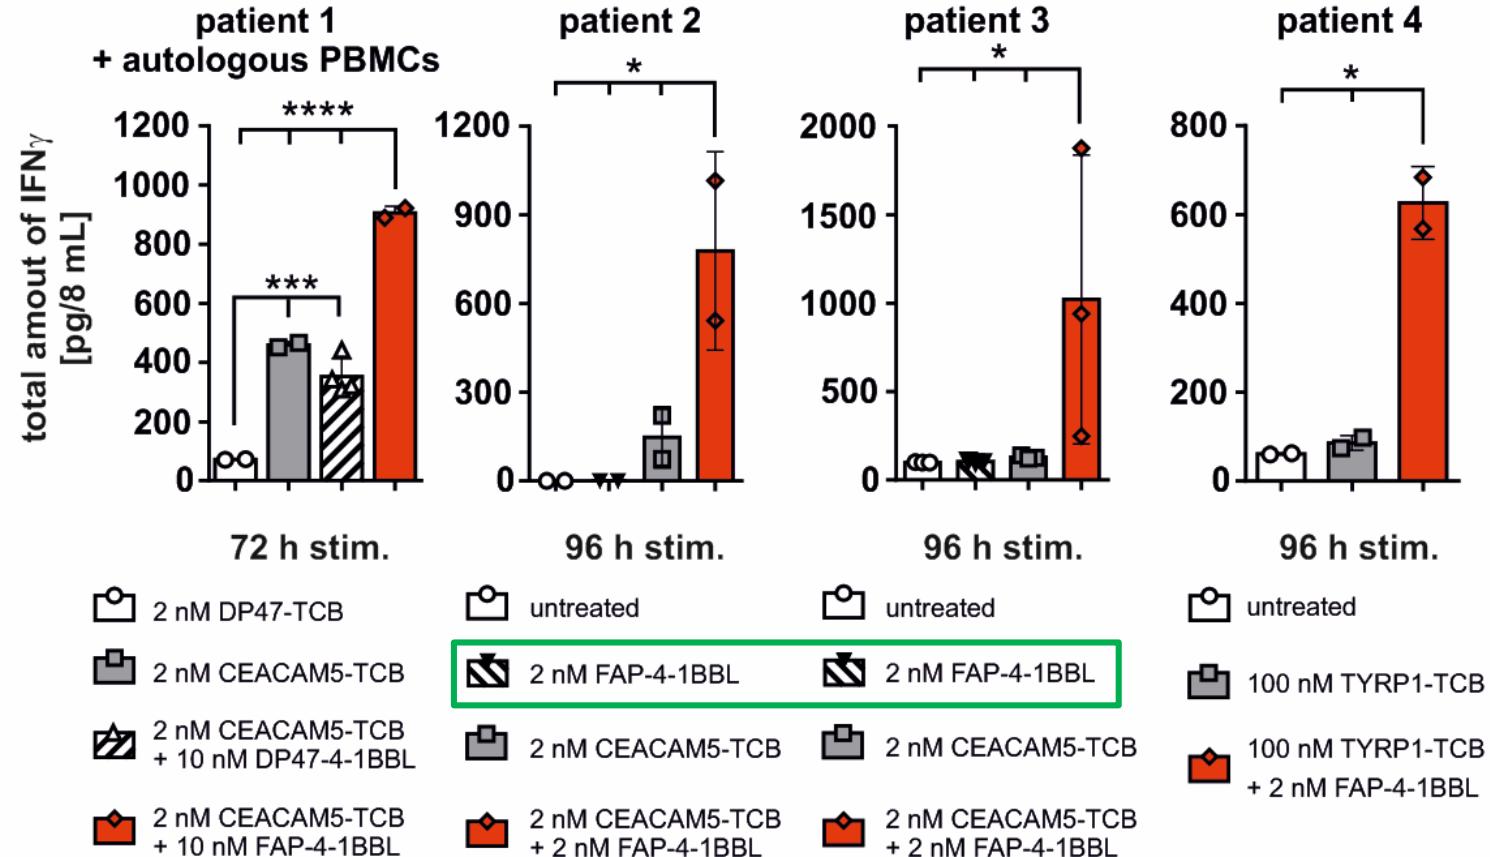

FAP-4-1BBL enhances TCB-mediated T cell activation in primary human tumor explants in 3D bioreactor

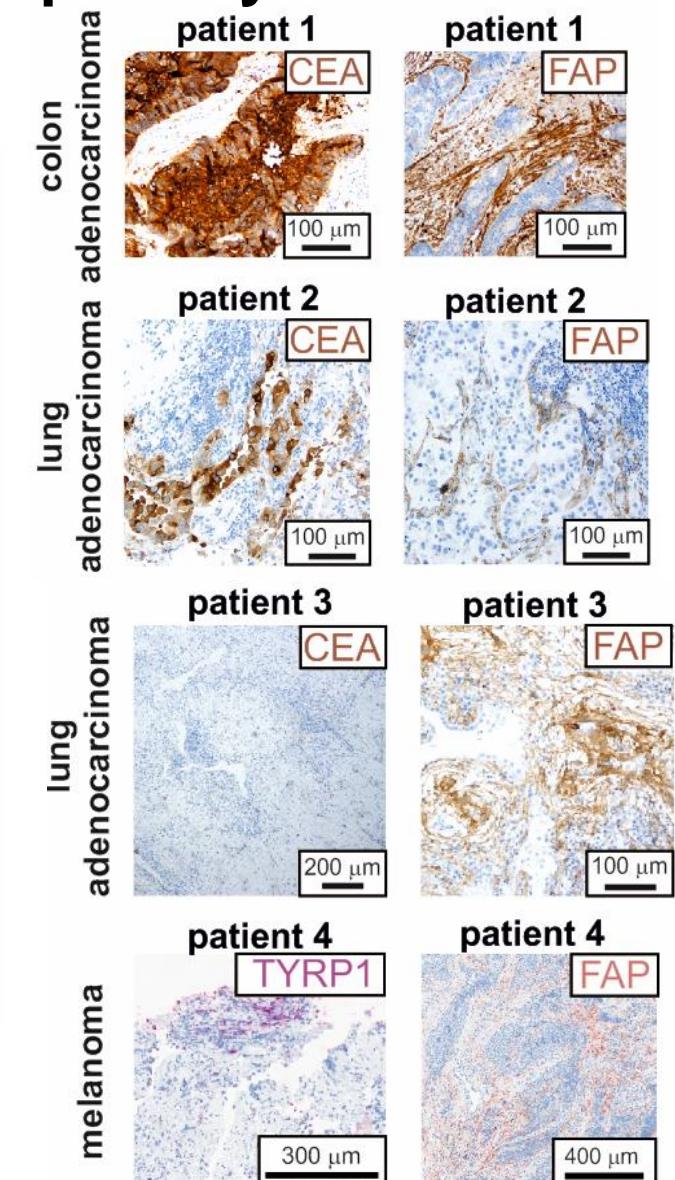

bioreactor for one condition containing 4-6 tumor slices

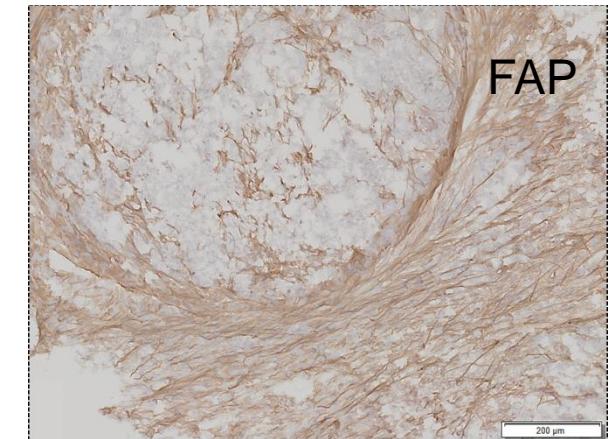

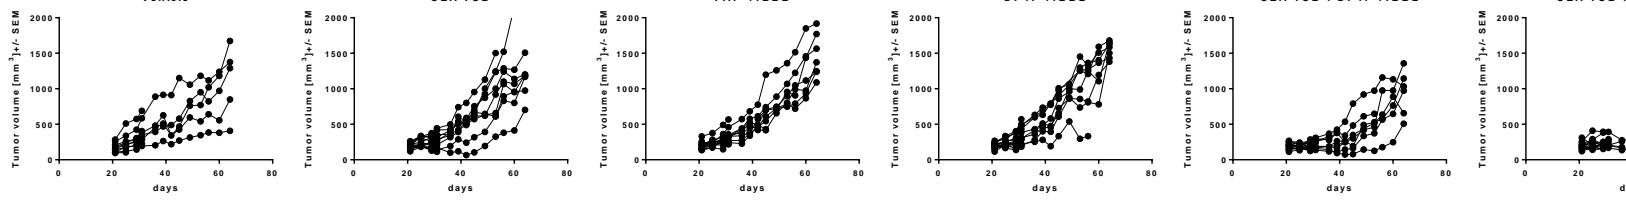

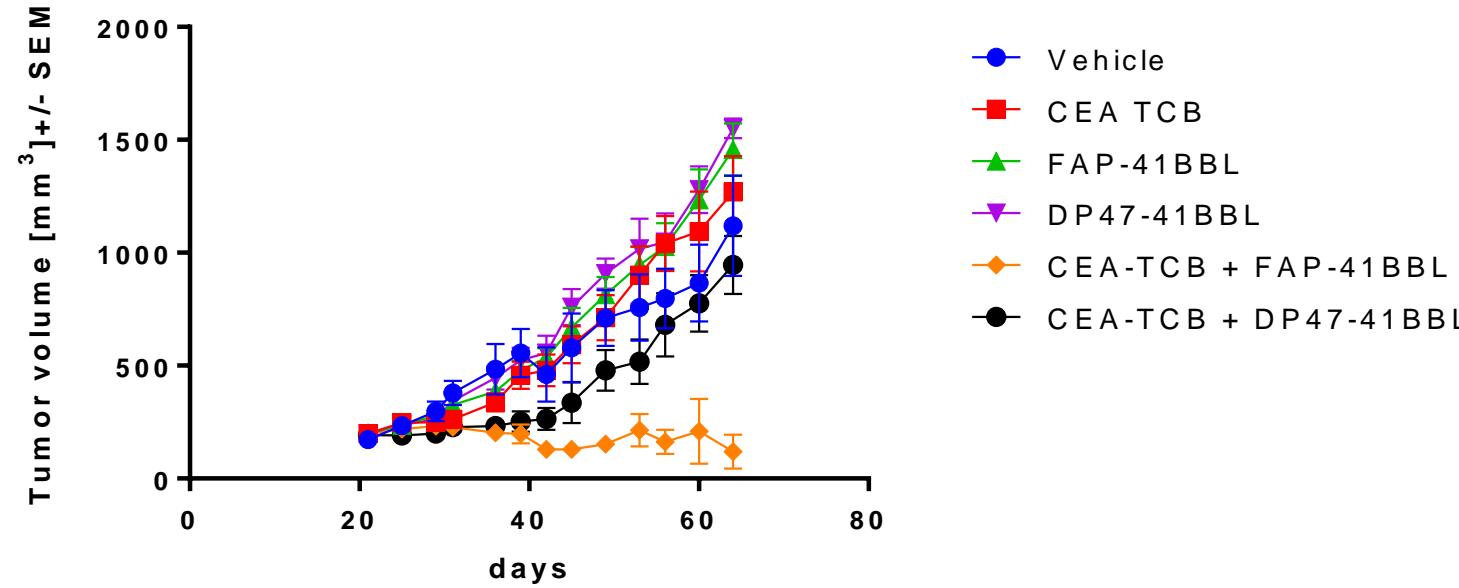

each symbol in the graphs indicates a different bioreactor with 4-6 tumor slices, number of bioreactors depends on tumor size (available tumor slices)

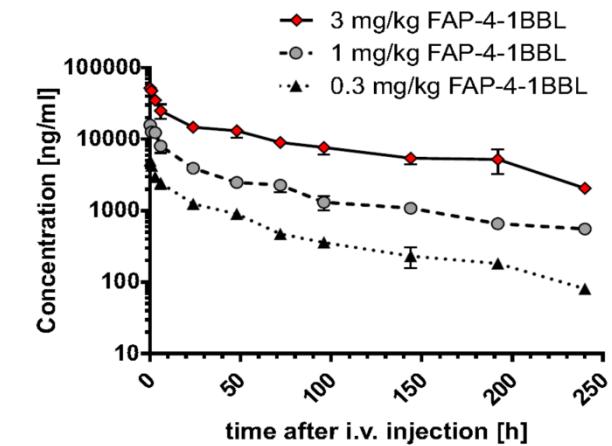

in two experiments a “FAP-4-1BBL only” condition was included, no immune activation above untreated control was seen.

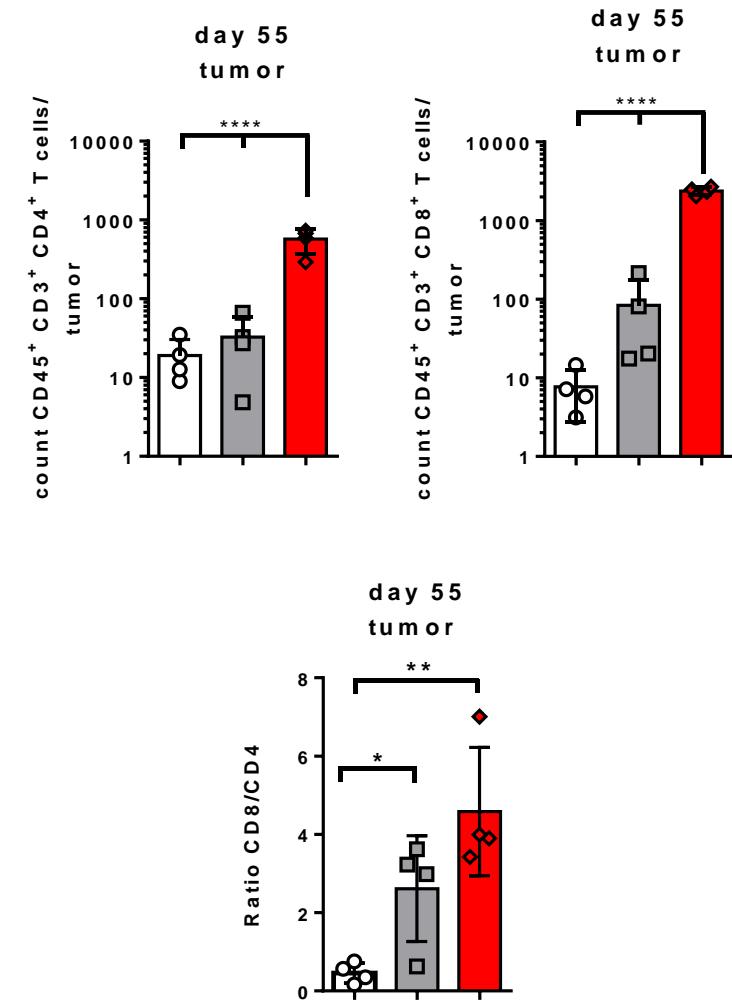

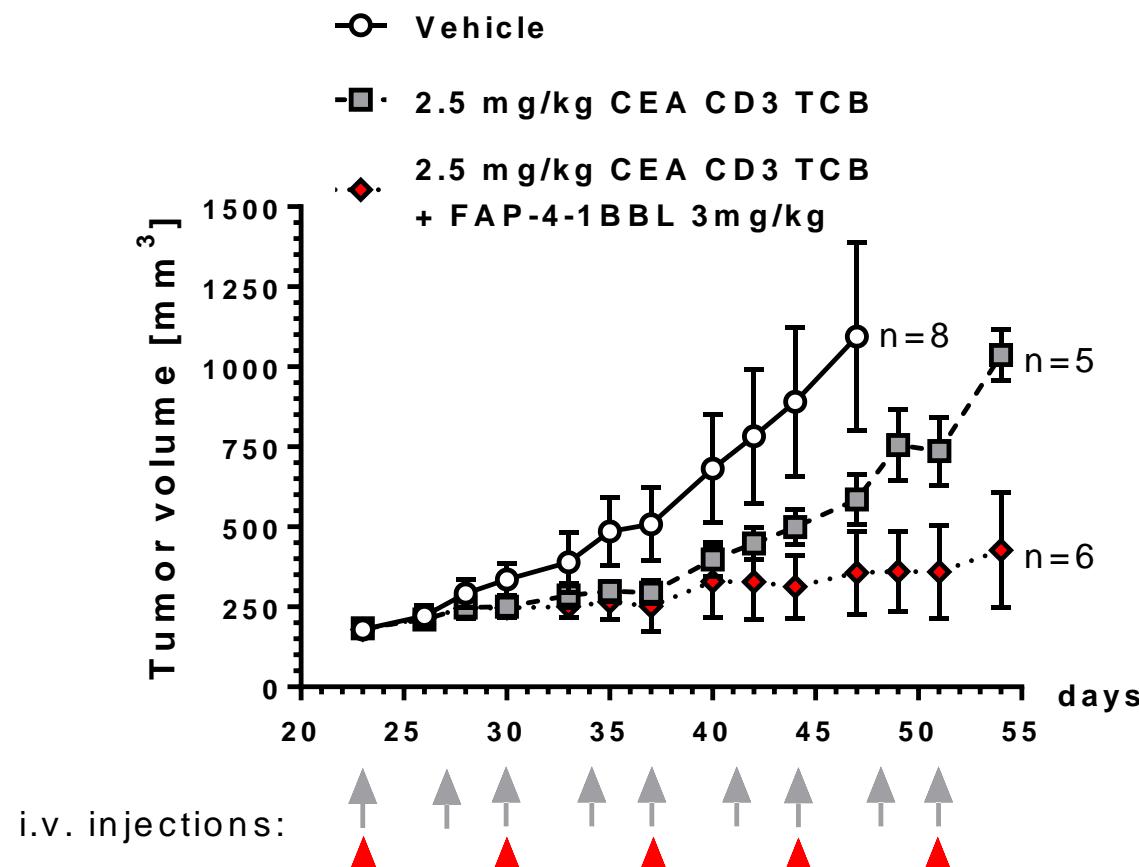

FAP-4-1BBL enhances efficacy of CEA-TCB in MKN45-3T3 fibroblast model in HSC-NSG mice

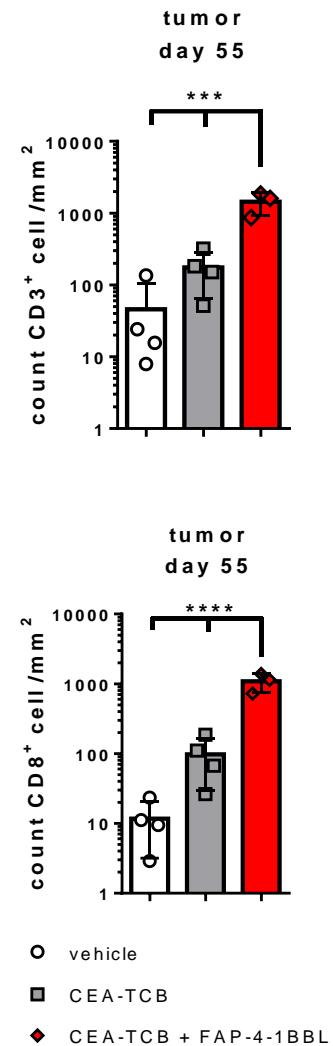

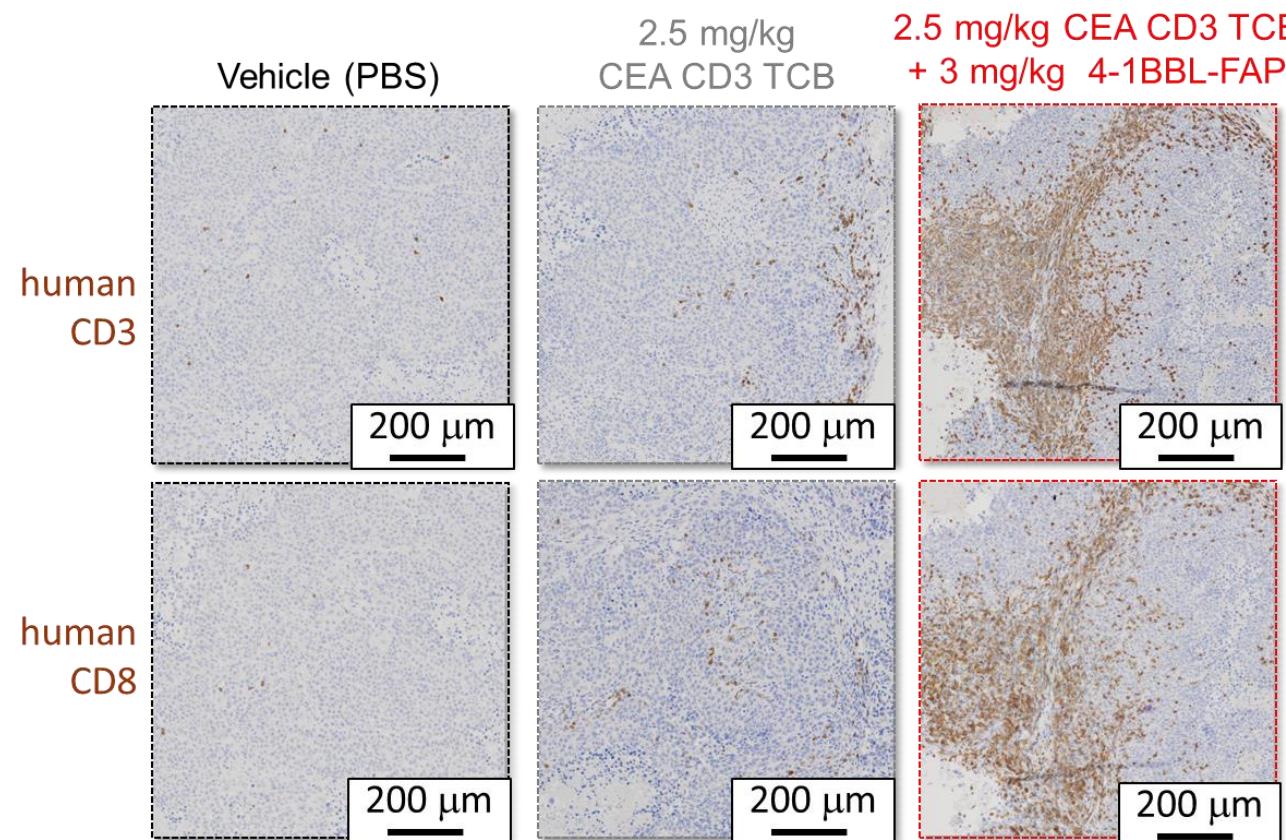

IgG-like pharmacokinetics

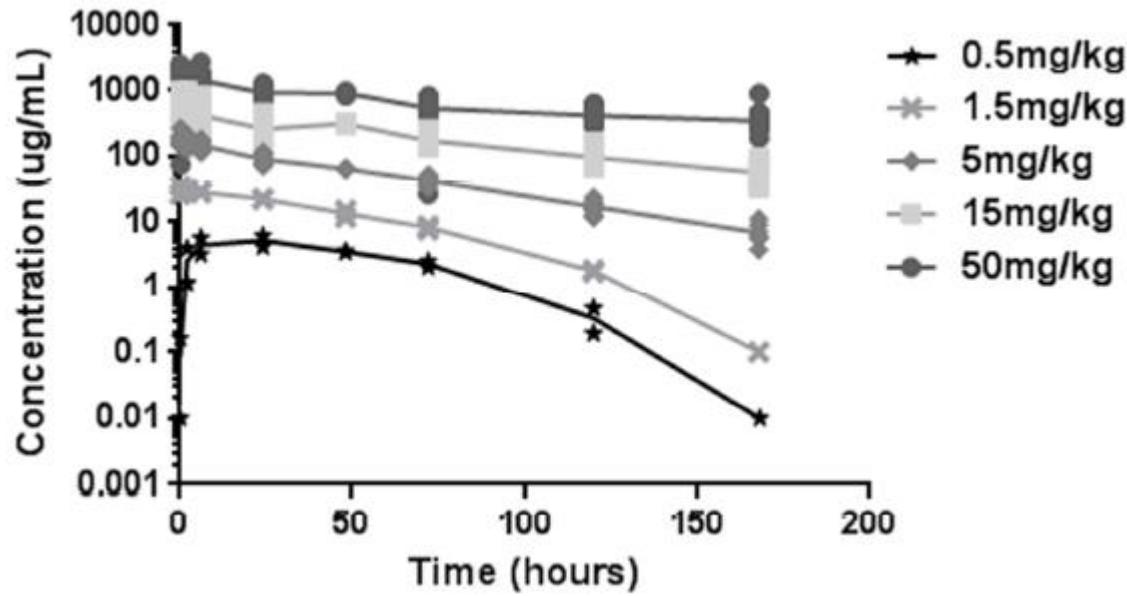

FAP-4-1BBL strongly enhances activity and T cell infiltration in combination with CEA-TCB in MKN45/3T3 HSC-NSG mice

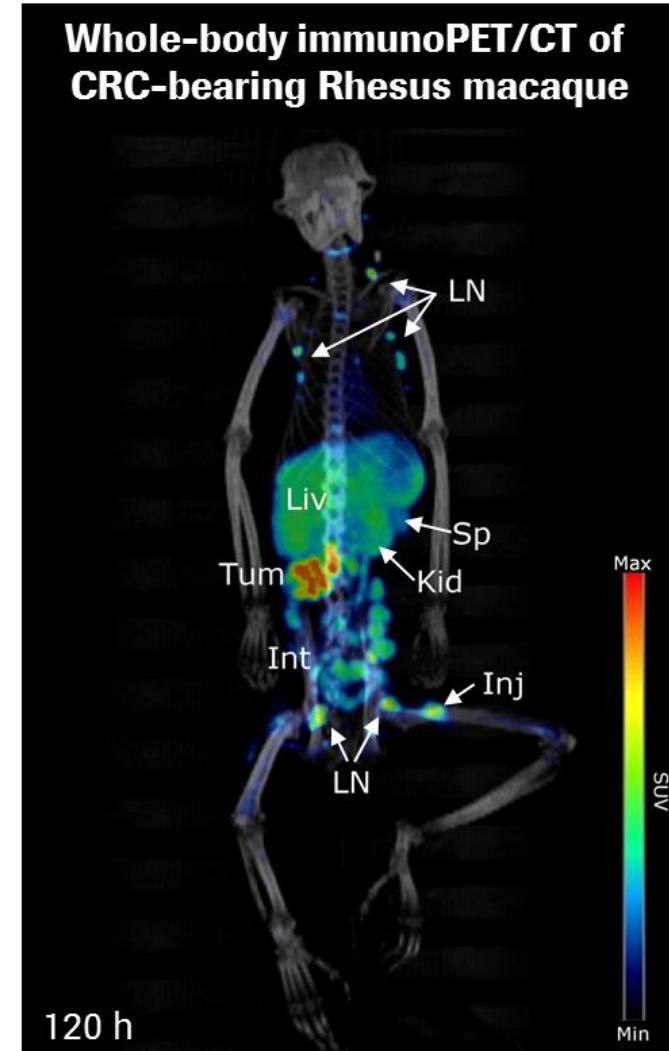

FAP-4-1BBL strongly enhances activity and T cell infiltration in combination with CEA-TCB in MKN45/3T3 NSG mice

FAP-4-1BBL has IgG1-like PK in cynomolgus monkeys & targets to tumor & lymph-nodes in macaque with CRC

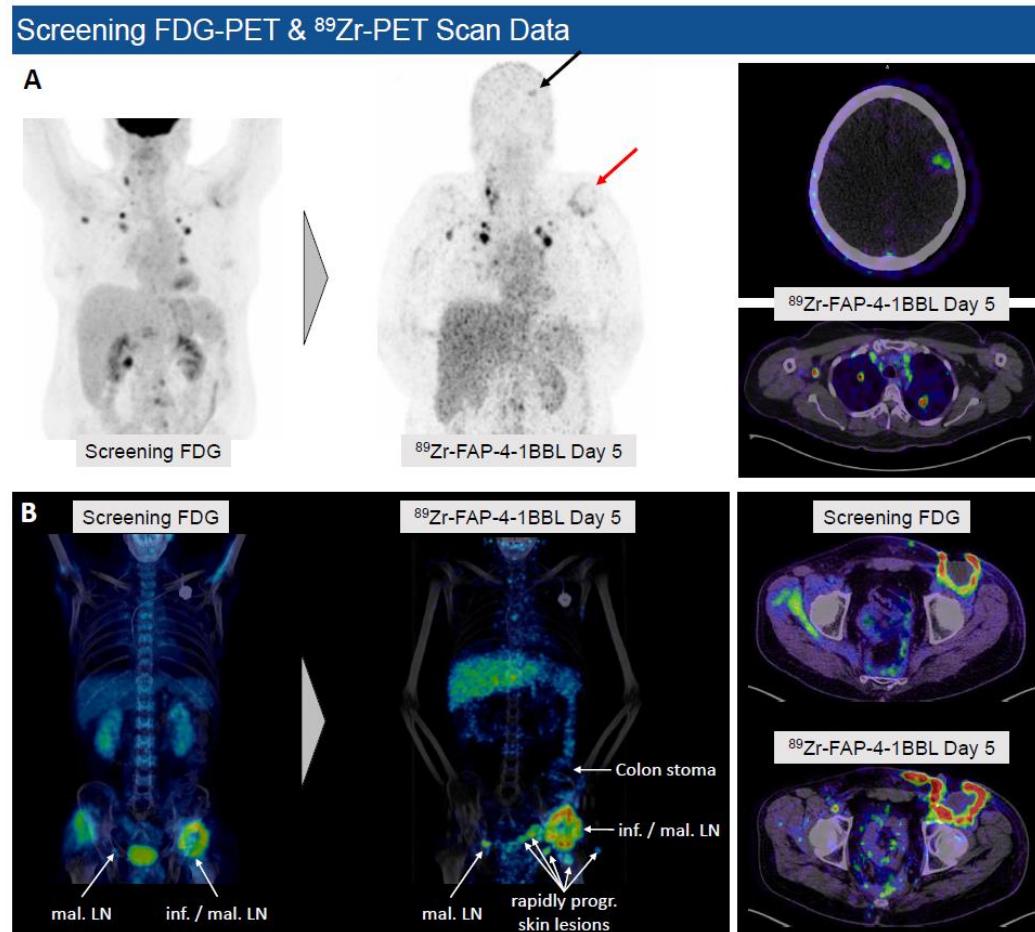

Accumulation in tumor, lymph nodes (FAP-mediated) and liver, kidney, and spleen (excretion and perfusion)

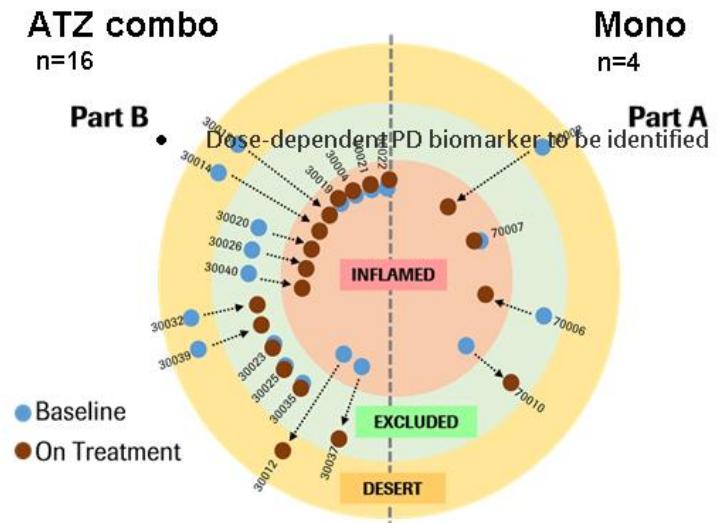

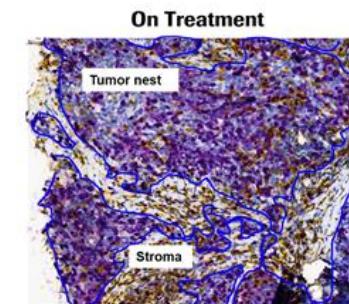

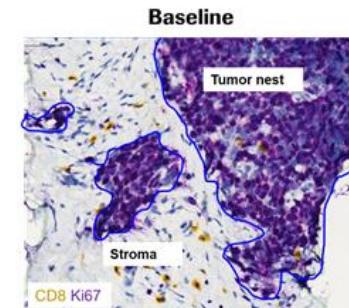

FAP-4-1BBL imaging and biomarker findings from Phase 1 study

FDG-PET & ^{89}Zr -PET scan data

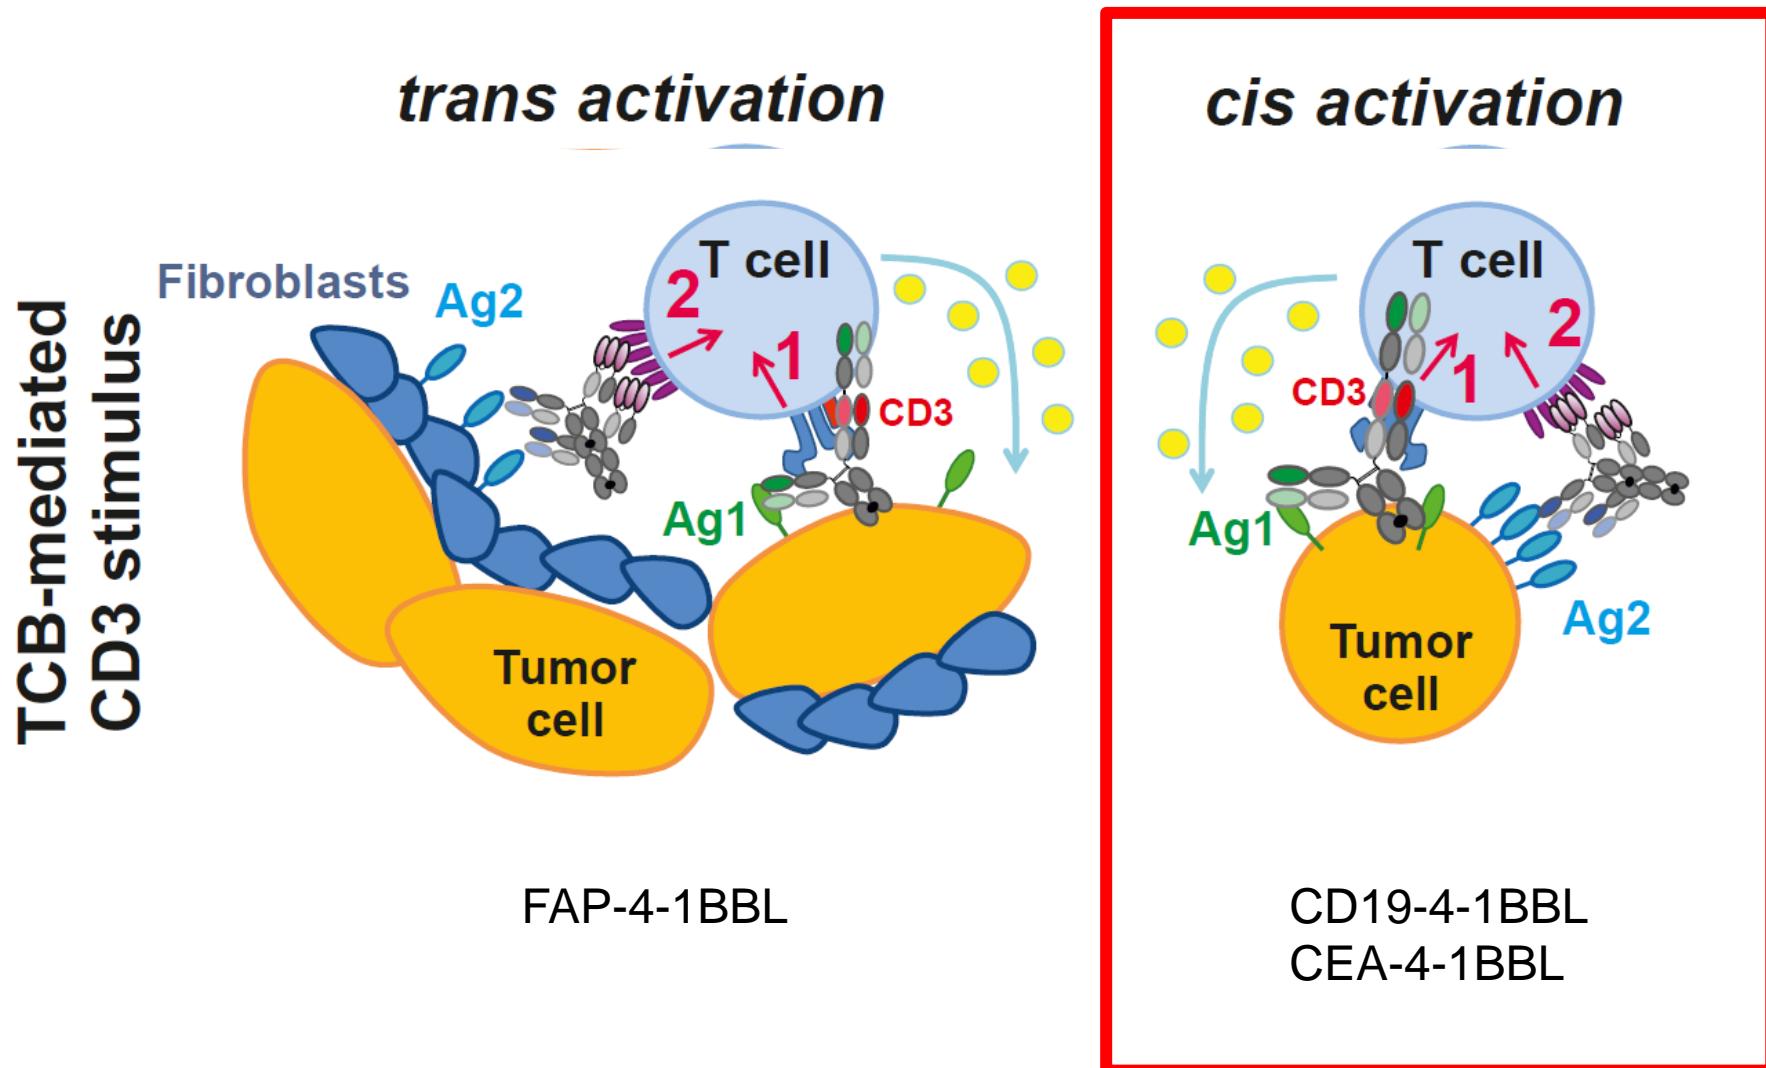

CD8 T cell infiltration and proliferation in stroma and tumor nests

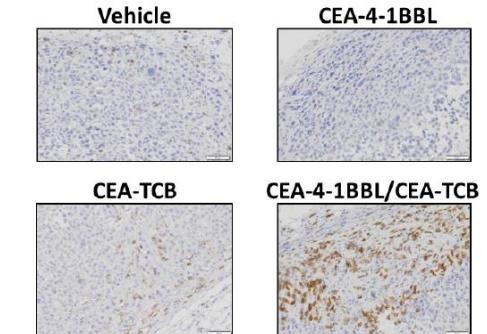

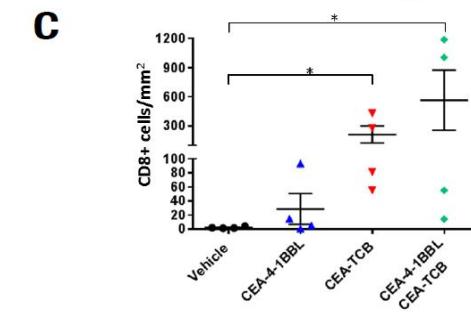

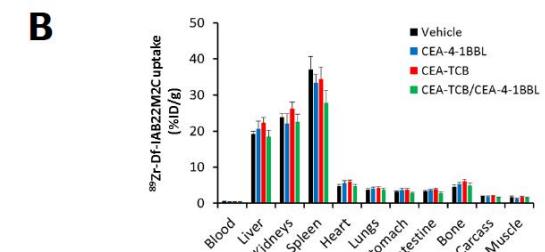

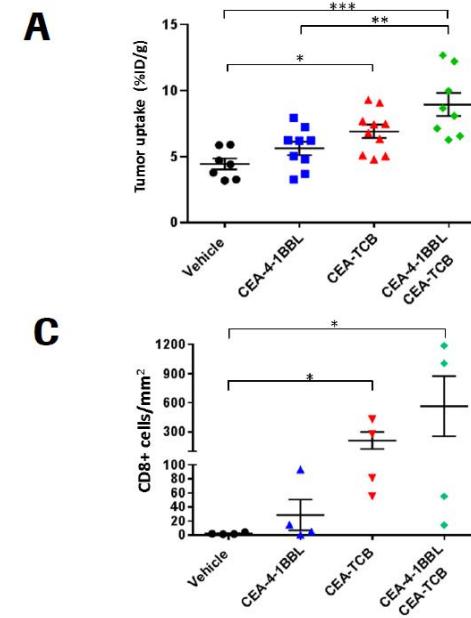

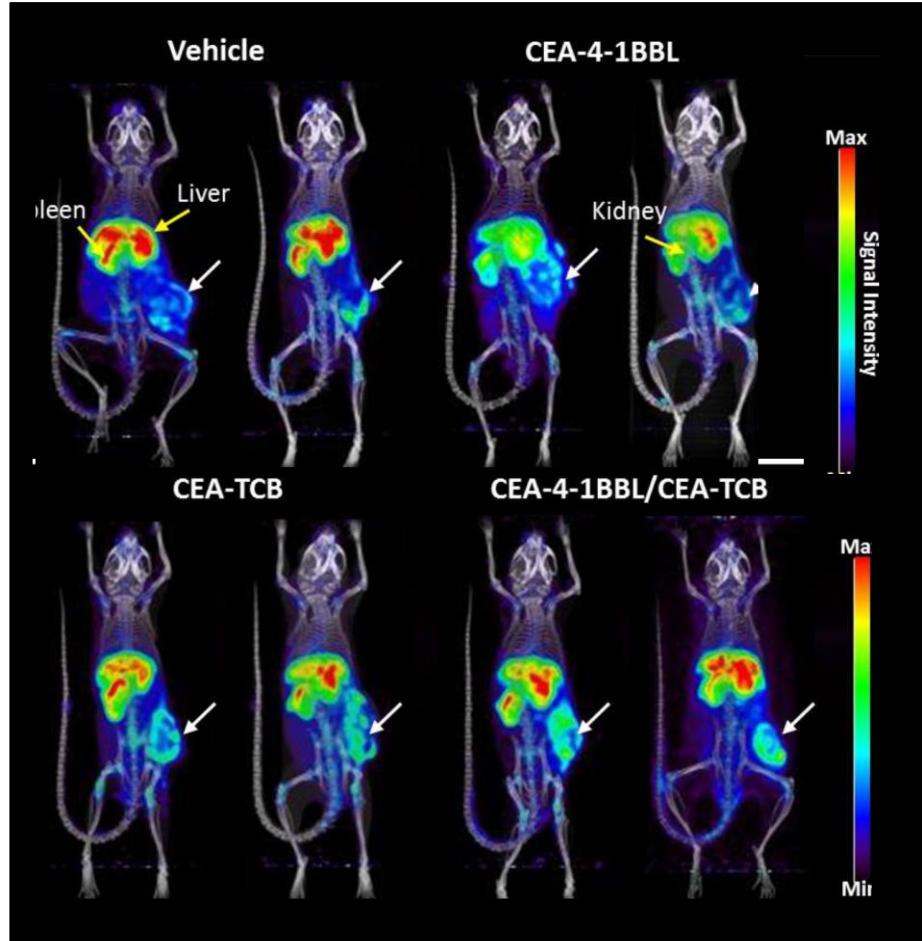

CD8 Increase in both stroma and tumor nests

TA-4-1BBL provides signal 2 in presence of T cell bispecific antibodies

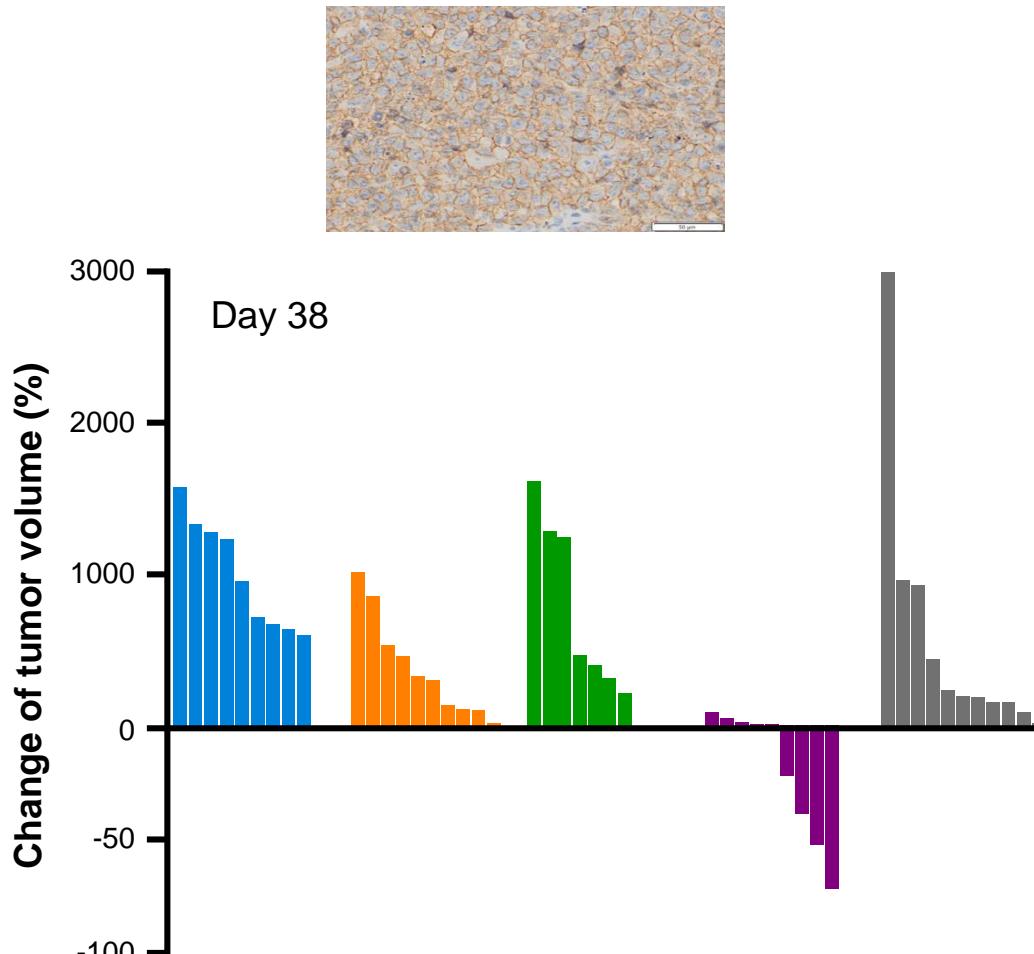

Imaging enhanced intratumoral CD8 infiltrates combining CEA-TCB with CEA-4-1BBL in HSC-NSG using the CD8 PET-tracer ^{89}Zr -Df-IAB22M2C

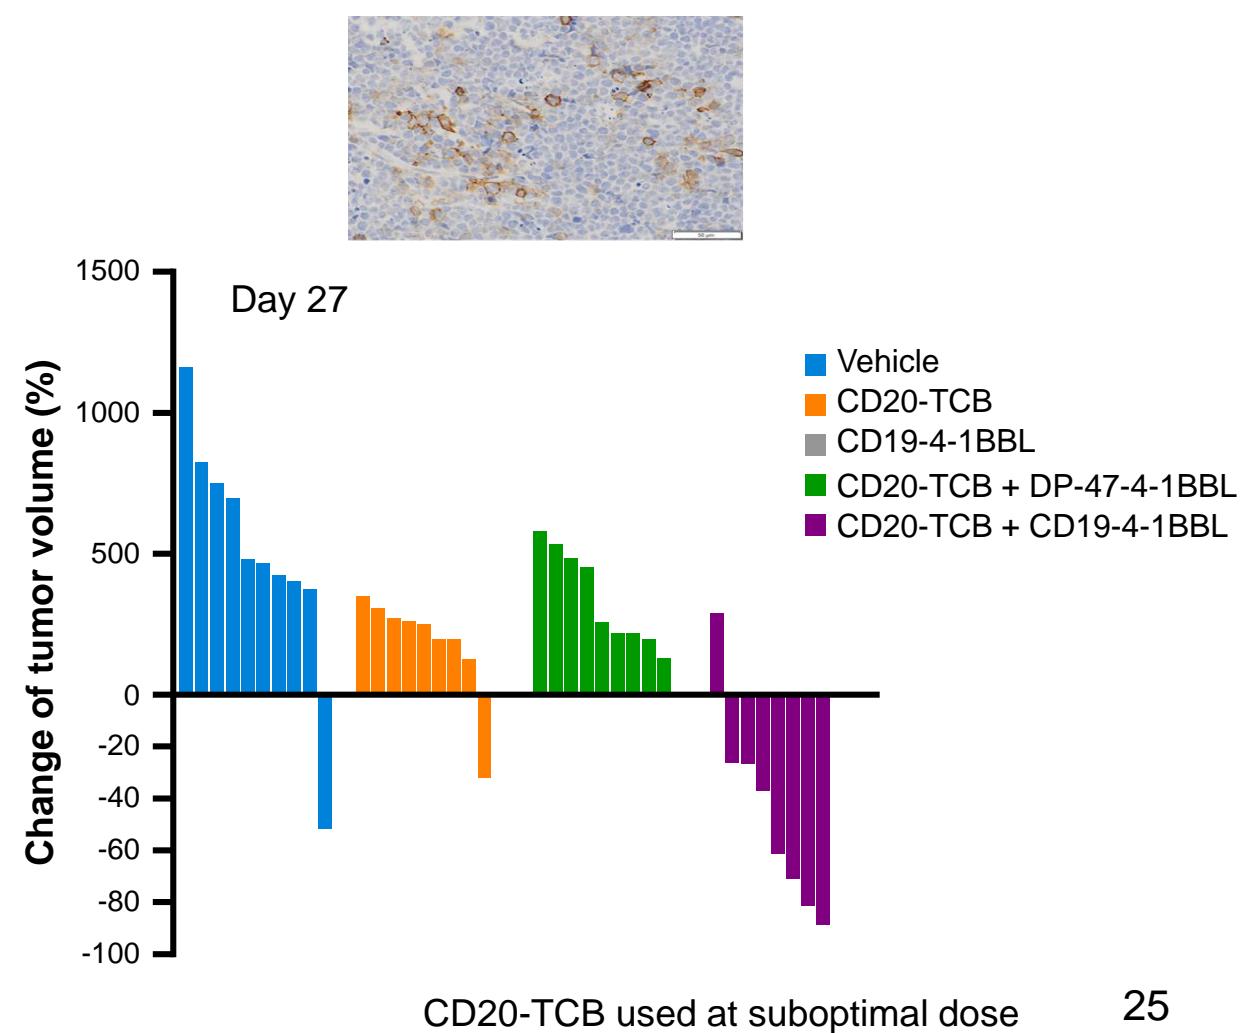

Combination of CD20-TCB and CD19-4-1BBL induces complete tumor regression in DLBCL models

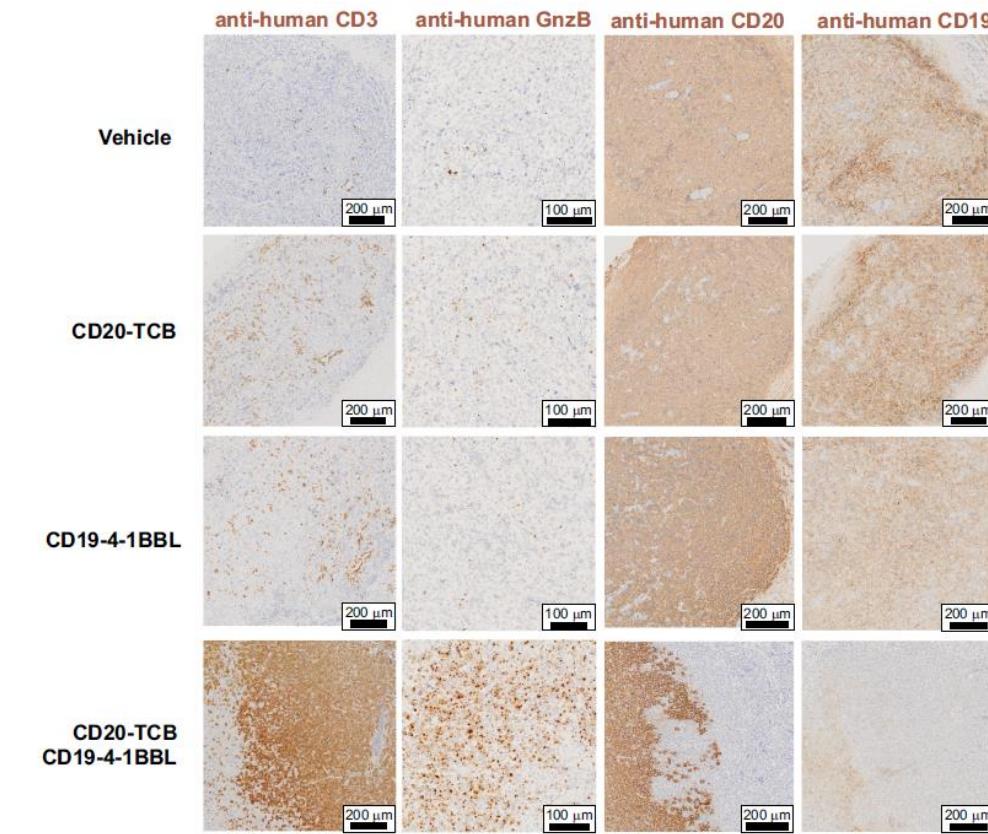

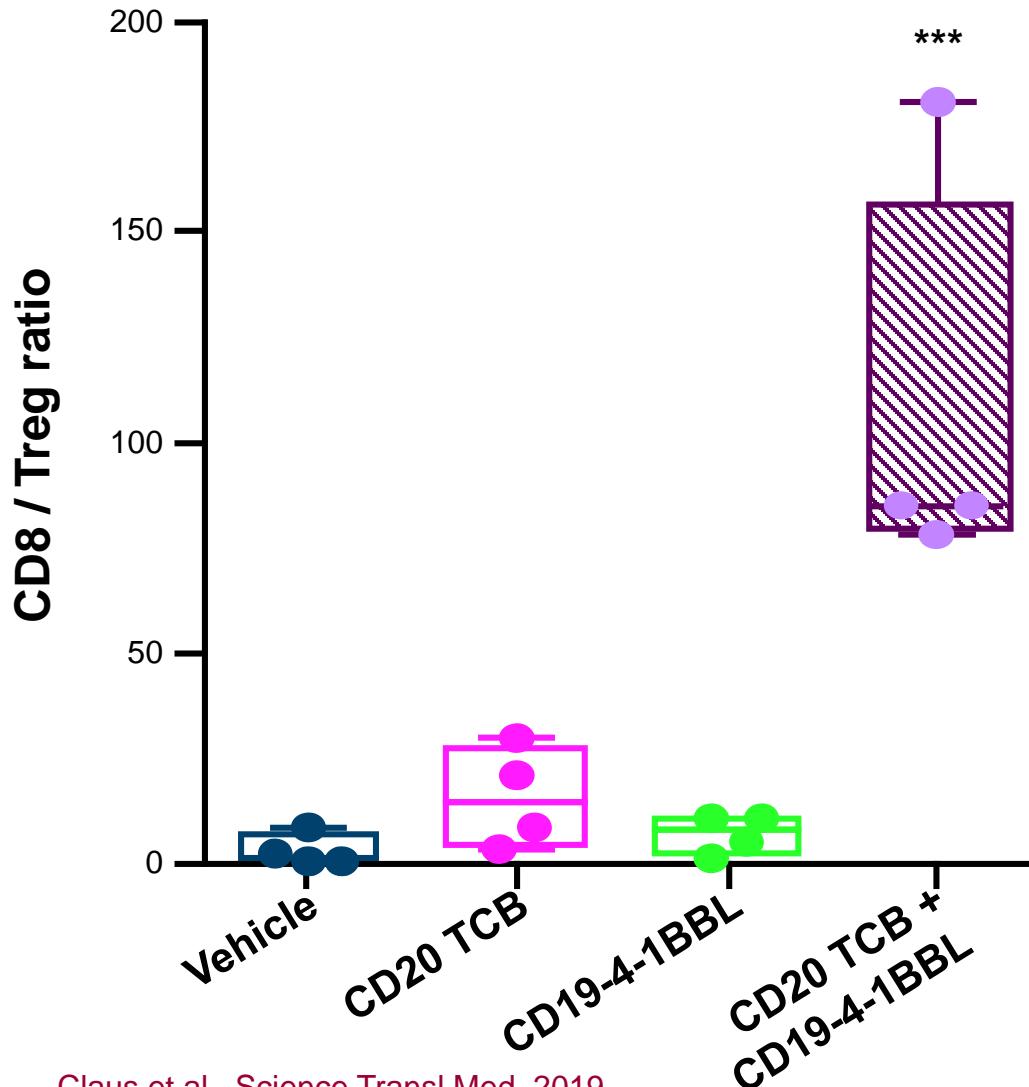

WSU-DLCL2 (CD20 high)

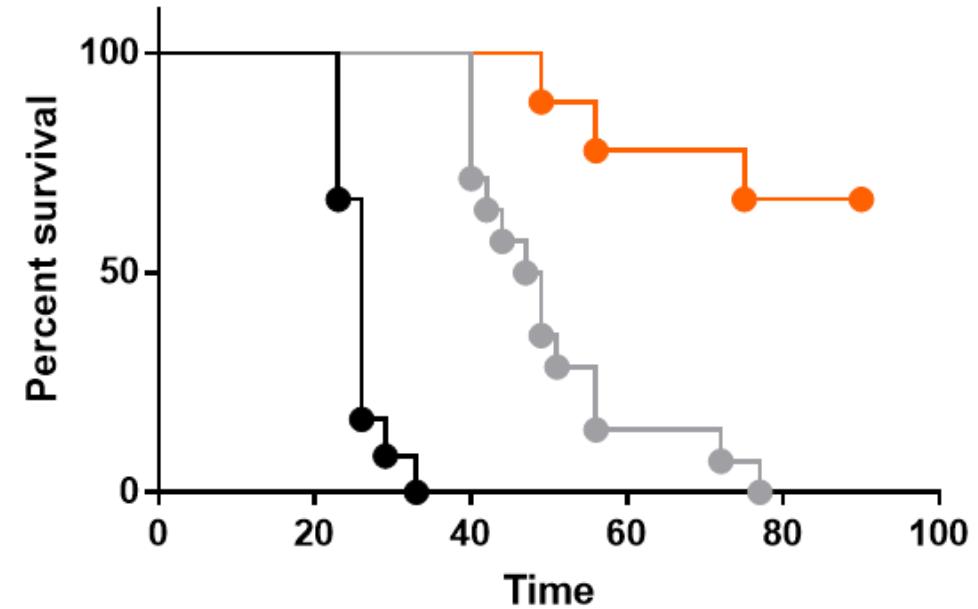

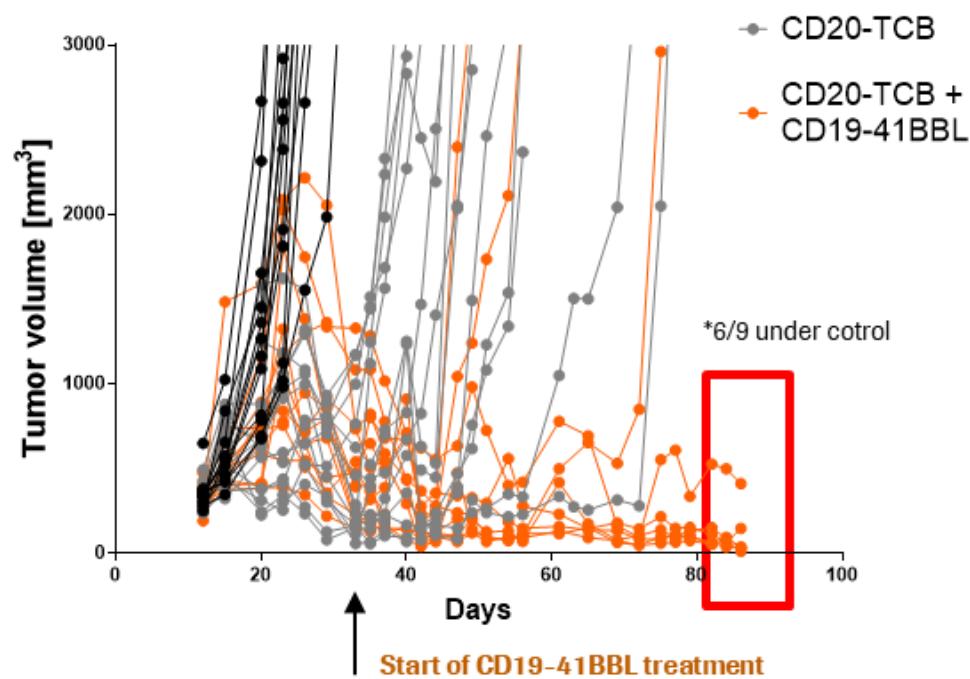

Nalm6 (CD20 low)

Combination of CD20-TCB and CD19-4-1BBL induces massive intratumoral T cell infiltration (WSU-DLCL2)

Combination of CD20-TCB and CD19-4-1BBL prevents tumor escape in the aggressive OCI-LY18 DLBCL model

TA-4-1BBL: FAP-4-1BBL & CD19-4-1BBL

- TA-4-1BBL induces efficient 4-1BB hyper-crosslinking on T cells in a strictly target dependent fashion
- TA-4-1BBL combined with a TCR stimulus provides co-stimulation to T cells resulting in T cell proliferation, differentiation and activation, and cytokine secretion
- TA-4-1BBL are potent combination partners for TCBs and strongly enhances T cell infiltration and activity =>TA-4-1BBL combined with TCBs provide a safe and effective alternative off-the-shelf approach to CAR T-cells
- Based on these data clinical Phase 1b studies are ongoing testing FAP-4-1BBL in combination with cibisatamab (CEA-TCB) (NCT04826003) and CD19-4-1BBL in combination with glofitamab (CD20-TCB) (NCT04077723)
